Abstract. *Ballomma* gen. nov. is described in the zodariid subfamily Cryptothelinae. It is characterized by the pairs of adjacent anterior median eyes and anterior lateral eyes and triangular palpal tarsus in the female, the concave tegulum with thin embolus in the male. Apart from the type species *B. erasmus* gen. et sp. nov. (♂♀), the genus contains *B. haddadi* gen. et sp. nov. (♂♀), *B. neethlingi* gen. et sp. nov. (♂♀), and *B. legala* gen. et sp. nov. (♀). A key to the species is provided. The restricted distribution of the genus is discussed.

Keywords. South Africa, Limpopo Province, montane forest, *Aschema*.

Jocqué R. & Henrard A. 2015. *Ballomma*, a new Afrotropical genus in the Cryptothelinae (Araneae, Zodariidae): eyes on the run. *European Journal of Taxonomy* 163: 1–24. <http://dx.doi.org/10.5852/ejt.2015.163>

Introduction

The Cryptothelinae remain a subfamily within the Zodariidae in which numerous novelties are to be expected. The recent description of *Palindroma* Jocqué & Henrard, 2015 with the discovery of a novel synapomorphy for the family, is symptomatic for this lack of knowledge. The subfamily has its distribution centre in southern Africa. Although South Africa has been fairly well inventoried in the last few years by the SANSA initiative (Dippenaar-Schoeman *et al.* 2015), many new taxa remain to be discovered such as in Limpopo, the northernmost province of the country. The area is characterized by a complex mosaic of biomes, with a high degree of endemism. Some of the mountain areas are among the oldest on the African continent and harbour species that belong to old evolutionary lineages (Jocqué *et al.* 2013). The species *Australutica africana* Jocqué, 2008 is one of these (Jocqué 2008). It was found in a thoroughly inventoried area in the Soutpansberg (Foord *et al.* 2008). Many of the other less important mountain ranges have only been inventoried superficially, but the few collections that have been made there, reveal a highly diverse fauna, often containing species with surprising affinities.

Here we describe a new genus with four new species, all collected at medium altitude in the Limpopo Province. One of the most remarkable characters of the genus is the position of the ALE which are very close together, an eye arrangement which is particularly rare. These eyes would not be recognized as ALE without the observation of intermediate positions between lateral and central in related genera.

Material and methods

Specimens were observed, drawn and measured with a WILD M 10 stereo microscope. Details of the female genitalia and male palps were observed with a Zeiss Stemi 2000 stereo microscope. Measurements and photographs of the habitus, details of mouthparts, detached male palps and female genitalia were taken with a Leica MZ16 using the LAS automontage software (ver. 3.8). The female genitalia were dissected and digested with pancreatin then immersed in 75% ethanol.

For scanning electron micrographs (SEM) photos, specimens were dried in Hexamethyldisilazane (36h), gold coated and examined and photographed with a JEOL 6480 LV scanning electron microscope. Types are deposited in the National Collection of Arachnids, Pretoria (NCA) and the Royal Museum for Central Africa, Tervuren, Belgium (MRAC).

All measurements are in mm. All palp illustrations are from left palps.

Abbreviations

ALE	=	anterior lateral eyes
ALS	=	anterior spinnerets
AME	=	anterior median eyes
d	=	dorsal

Subfamily Cryptothelinae Simon, 1892

Ballomma gen. nov.

[urn:lsid:zoobank.org:act:CF0FE505-E714-4A09-8575-CFFC06C32C9A](https://zoobank.org/urn:lsid:zoobank.org:act:CF0FE505-E714-4A09-8575-CFFC06C32C9A)

Type species

Ballomma erasmus gen. et sp. nov.

Diagnosis

Ballomma gen. nov. is a member of the Cryptothelinae characterized by the eye position with touching ALE and AME, the shield-shaped sternum without or with tiny precoxal sclerites, the female palp with triangular flattened palpal tarsus, the male palp with concave tegulum accommodating the thin, slightly curved embolus directed diagonally over the tegulum and the epigyne with cul-de-sac ducts.

Etymology

The genus name is derived from the combined Greek terms βαλλω (= to touch) and ομμα (=eye), referring to the touching anterior lateral eyes. The gender is neuter.

Affinities

Ballomma gen. nov. clearly belongs to the Cryptothelinae, a subfamily of the Zodariidae that has been characterized by nomenclatorial problems: poor definitions and misplacements (Jocqué 1991; Jocqué & Henrard 2015). It has the modified endites and an eye position of a type that only occurs in that subfamily. The present genus has some superficial resemblance with *Capheris* Simon, 1887 with which it shares the triangular female palpal tarsus and the closely set AME and ALE. However, in *Ballomma* gen. nov. the eyes are even more closely set and characters of sternum, carapace profile and structure of the genitalia are all different. As for the latter character there is a superficial resemblance with *Aschema* Jocqué, 1991 from Madagascar in which the ALE and AME are also very closely set. The shape of a number of undescribed *Aschema* species have somatic and genitalic characters that come close to those of the *Ballomma* gen. nov. species in the present article. However, the characteristics of the sternum and carapace and of the genitalia, and the modified leg IV, clearly separate them from the genus here described.

Description

HABITUS. Medium size to small spiders (4.5–7.5) with smooth teguments. Carapace longer than wide ($L/W < 1.4$ – 1.6), without setae apart from a few longer hairs on clypeus; widest at level of coxae II–III, narrowed to about 0.43–0.66 times maximum width in eye region (cephalic width measured on posterior tangent of PME). Cervical grooves poorly indicated. Profile: flat; fovea in shallow depression.

COLOURATION. Carapace medium brown; chelicerae, legs, mouthparts and sternum medium to orange brown; abdomen dorsum with complex dark pattern on pale background; in some cases with four apodemes, sides grey, venter pale sometimes with dark pattern; in males sclerotized in front of epigastric fold and slightly sclerotized in front of spinnerets.

EYES. In three rows; ALE in front of AME and touching each other; AME close together sometimes touching; posterior row recurved, eyes apart. All eyes pale and subequal. Clypeus retreating, height 2.5 to 3.6 times diameter of AME, with some dispersed setae.

PROSOMA. Chilum double, sometimes poorly delimited, slightly more than twice as wide as high; no setae. Chelicerae conical with many evenly dispersed setae; fangs shorter than wide at base. Labium triangular, narrowed base. Endites roughly triangular, converging, with basolateral extension accommodating palpal coxae. Sternum shield-shaped, as wide as long or slightly longer than wide, without triangular extensions or precoxal sclerites; anterior margin straight, lateral margins slightly sinuous.

LEGS. Slender; formula 4123. Spination reduced on legs I and II, well developed on III and IV with spines numerous on T and Mt III and IV. Spines slender. With few or without hinged hairs.

FEMALE PALP. With tarsus triangular and flattened, with row of prolateral thorns, retrolaterally with some thin spines; palpal claw with some small teeth at base; turned inward over less than 35°; without distal patch of chemosensitive setae.

ABDOMEN. Oval; tracheal spiracle small, somewhat advanced. Females and juveniles with six spinnerets. Female ALS large, conical, biarticulate. PLS without, PMS with one cylindrical gland spigot. Colulus represented by field with few setae.

MALE PALP. Patella sometimes with swelling; RTA variable; cymbium with well developed basal flange and with group of truncated subapical thorns; subtegulum strongly developed, with transverse ridges; tegulum with prolateral concavity, distally with dorsal and ventral extensions; accommodating thin, slightly curved embolus, directed diagonally over tegulum. Epigyne simple, with internal structure characterized by cul-de-sac ducts, visible in transparency.

Distribution

Ballomma gen. nov. is so far only found in the mountain forests of the Limpopo Province in northern South Africa.

Key to the species (male of *B. legala* unknown)

1. Males2
- Females4
2. Area in front of epigastric fold with field of spinules (Figs 1D, 11C); embolus base without or with small appendage (Figs 3B, 12B)3
- Area in front of epigastric fold without field of spinules; embolus base with large, strongly sclerotized pointed appendage (Fig. 7B)*B. haddadi* gen. et sp. nov.
3. Distal part of RTA with transparent concave part (Fig. 12A); embolus almost straight, short, half as long as tegulum, tegular process small, directed medially (Fig. 12B)*B. neethlingi* gen. et sp. nov.
- Distal part of RTA without transparent concave part (Fig. 3A); embolus curved, almost as long as tegulum, tegular process larger, directed apically (Fig. 3B)*B. erasmus* gen. et sp. nov.
4. Frontal part of epigyne with V-shaped ducts visible in transparency (Figs 10A, B), anterior part of endites with field of strong spinules (Fig. 9E)*B. legala* gen. et sp. nov.
- Frontal part of epigyne without V-shaped pattern (Figs 3C, 7C); endites without spinules5
5. Pattern of internal structure of epigyne X-shaped (Fig. 12C)*B. neethlingi* gen. et sp. nov.
- Pattern of internal structure of epigyne not X-shaped (Figs 3C, 7C)6
6. Pattern of epigyne with two ring-shaped ducts in front, followed by procurved cul-de-sac ducts (Fig. 3C)*B. erasmus* gen. et sp. nov.
- Pattern of epigyne with cul-de-sac ducts in front, without ring-shaped ducts (Fig. 7C)*B. haddadi* gen. et sp. nov.

Ballomma erasmus gen. et sp. nov.

[urn:lsid:zoobank.org:act:A6681529-ED54-46CF-B39D-E7862EBED809](https://zoobank.org/urn:lsid:zoobank.org:act:A6681529-ED54-46CF-B39D-E7862EBED809)

Figs 1A–D, 2A–D, 3A–C, 4A–D, 5A–C, 14

Diagnosis

The male of *B. erasmus* gen. et sp. nov. is easily recognized by the field of spines in front of the epigastric fold and the RTA with three short elements. The female is characterized by the S-shaped ducts in the anterior half of the epigyne.

Etymology

The species name is a noun in apposition taken from the type locality.

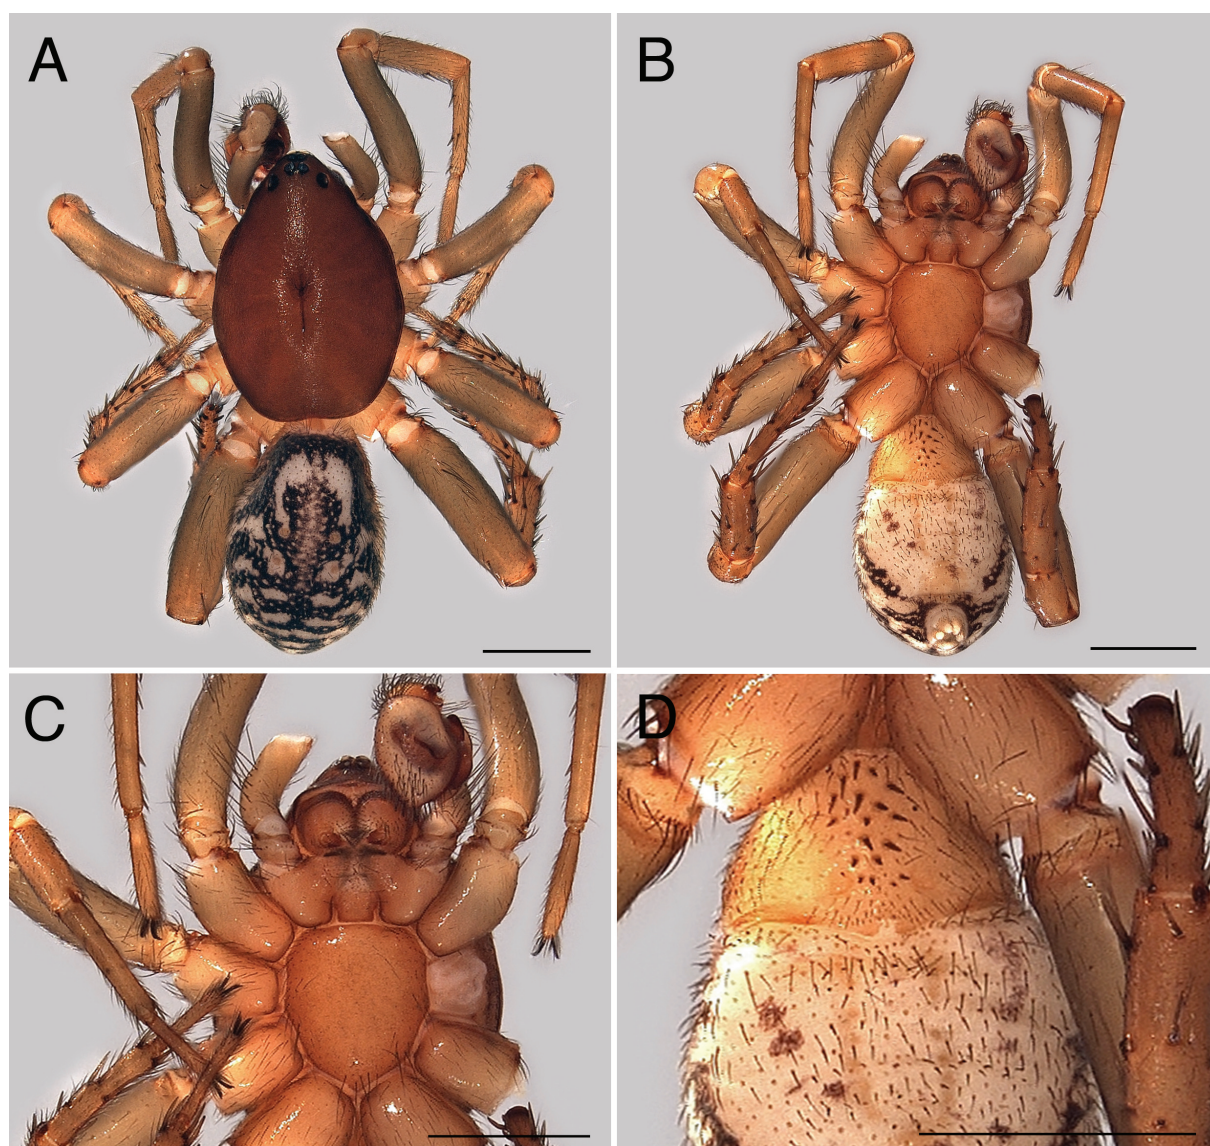

Fig. 1. *Ballomma erasmus* gen. et sp. nov. Holotype, ♂. **A.** Habitus, dorsal view. **B.** As preceding, ventral view. **C.** Prosoma, ventral view. **D.** Abdomen, ventral view. Scale bars: 1 mm.

Type material

Holotype

SOUTH AFRICA: ♂, Ga-Moraba, Abel Erasmus Pass, 24°27'06" S 30°36'27" E, 4 Oct. 2012, forest, sifting litter, J.A. Neethling (NCA 2015/3485; ex MRAC 241636).

Paratypes

SOUTH AFRICA: 3 ♀♀, same data as holotype (1 ♀ kept in MRAC 241636).

Fig. 2. *Ballomma erasmus* gen. et sp. nov. **A–C.** Paratype, ♀. **D.** Holotype, ♂. **A.** Habitus, dorsal view. **B.** As preceding, ventral view. **C.** As preceding, lateral view. **D.** Habitus, lateral view. Scale bars: 1 mm.

Description

Male (holotype)

MEASUREMENTS. Total length 4.97; carapace 2.63 long, 0.99 high, 1.85 wide, narrowed to 0.85 in eye region.

COLOURATION. Carapace (Fig. 1A) medium brown without silvery setae; chelicerae medium brown in basal half, pale brown in distal half, sternum brownish orange (Fig. 1B–C); legs uniform pale yellowish brown, femora with greenish tinge; abdomen (Fig. 1A–B, D): dorsum and sides pale with complex dark pattern; venter pale, yellowish sclerotized areas in front of spinnerets and in front of epigastric fold; spinnerets pale yellow.

CARAPACE (Figs 1A, 2D). Smooth, strongly narrowed in front; flat, fovea long, in shallow depression. Chilum double, each sclerite 0.05 high, 0.13 wide; no setae. Sternum shield-shaped, 1.07 long, 0.85 wide.

EYES. AME: 0.08; ALE: 0.11; ALE–ALE: 0.00; AME–ALE: 0.05; PME: 0.10; PLE: 0.12; PME–PME: 0.03; PME–PLE: 0.13. Clypeus 0.21 or 2.6 times width of ALE, strongly retreating.

LEGS. Anterior tarsi shorter than metatarsi and fusiform; hinged hairs on TI and TII.

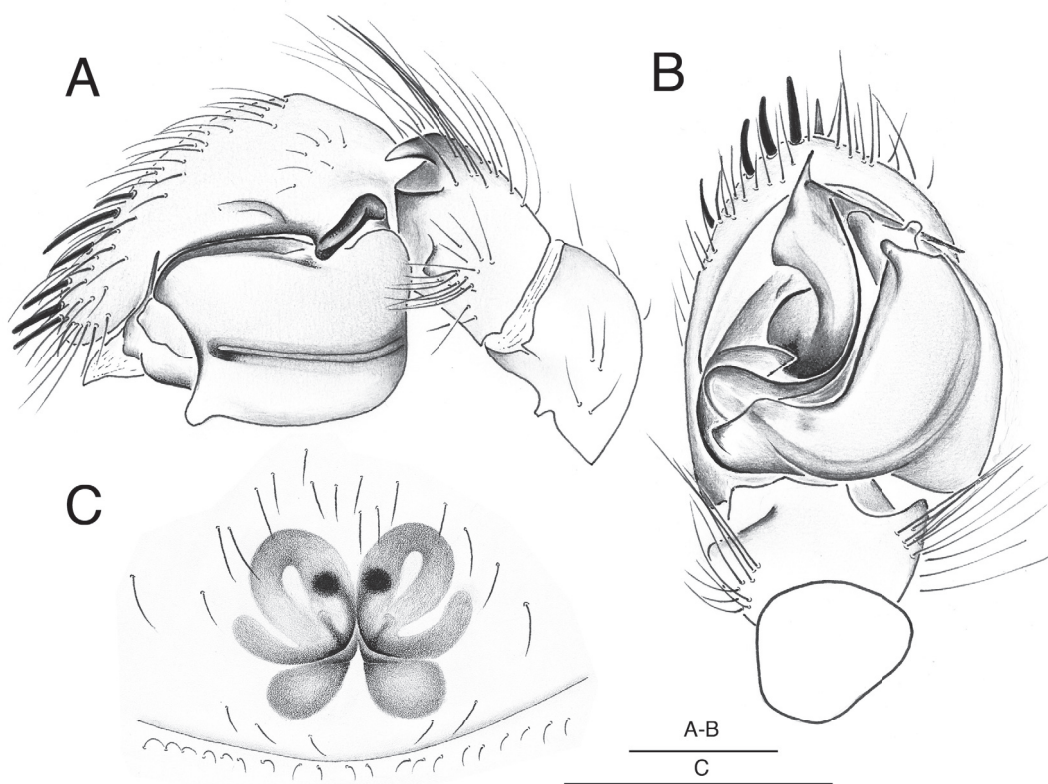

Fig. 3. *Ballomma erasmus* gen. et sp. nov. A–B. Holotype, ♂. C. Paratype, ♀. A. Male palp, retrolateral view. B. As preceding, ventral view. C. Epigyne, ventral view. Scale bars: 0.5 mm.

Fig. 4. *Ballomma erasmus* gen. et sp. nov. **A–C.** Holotype, ♂. **D.** Paratype, ♀. **A.** Male palp, retrolateral, slightly posterior and dorsal, view. **B.** As preceding, ventral view. **C.** As preceding, prolateral view. **D.** Epigyne, ventral view. Scale bars: 0.2 mm.

ABDOMEN (Figs 1 A–B, D, 2D). Area in front of epigastric fold with 15 small spines. Spinnerets as for genus.

MALE PALP (Figs 3A–B, 4A–C). Femur with long ventral setae in distal half; patella without boss; tibia with tuft of long setae along distal dorsal margin; RTA with short sharp hook dorsolaterally, lateral and ventrolateral knobs; cymbium with large curved retrolateral basal flange, seven distal, truncated spines; subtegulum with three curved ridges; tegulum large, distal extremity with ventral knob and dorsal flange; sperm duct conspicuous, slightly sinuous.

Female (paratype together with holotype)

MEASUREMENTS. Total length 4.47; carapace 2.06 long, 1.28 wide, 0.71 high, narrowed to 0.85 in eye region.

COLOURATION. Carapace (Fig. 2A, C) medium brown with dark margin and faintly delimited triangle suffused with black in front of fovea; chelicerae (Fig. 2B) medium brown; legs and sternum yellow; abdomen (Fig. 2A–C): dorsum and sides dark sepia with complex pale pattern; venter pale with few darker spots; spinnerets yellow.

CARAPACE. Smooth. Clypeus with dispersed setae. Chilum poorly delimited. Sternum shield-shaped, 0.92 long, 0.71 wide.

Fig. 5. *Ballomma erasmus* gen. et sp. nov. Paratype, ♀. **A.** Epigyne, cleared, ventral view. **B.** As preceding, dorsal view. **C.** Epigyne, SEM, dorsal view. **D.** As preceding, detail. Scale bars: A–B = 0.2 mm; C = 0.1 mm; D = 50 μ m.

IV	1.26	0.63	0.98	1.19	0.70	4.76

PALP. Triangular (Fig. 2B), slightly flattened ventrally, with row of prolateral short spines; claw with three teeth, not turned inward.

EPIGYNE (Figs 3C, 4D, 5A–D). Roughly quadrangular; anterior ducts clearly visible, S-shaped disrupting the X-shape; spermathecae fairly small separated by about half their distance.

Distribution

Only known from the type locality in the Limpopo Province, South Africa (Fig. 14).

Ballomma haddadi gen. et sp. nov.

[urn:lsid:zoobank.org:act:20DEADCF-E2D1-47AA-AC36-29DF62B1A304](https://zoobank.org/act:20DEADCF-E2D1-47AA-AC36-29DF62B1A304)

Figs 6A–F, 7A–C, 8A–D, 14

Diagnosis

The male of *B. haddadi* gen. et sp. nov. is easily recognized by the peculiar palp with the long, thin, sinuous embolus provided at its base with a large, sharp process pointing forward. The female has a characteristic epigyne with dark central area from where procurved cul-de-sac tubes originate, followed by well-separated spermathecae.

Etymology

The species name is a patronym in honor of Charles Haddad for his many contributions on African arachnology.

Type material

Holotype

SOUTH AFRICA: ♂, Transvaal (now Limpopo Province), Pietersburg District, Woodbush Forest, 23°54' S 29°27' E, Sep. 1960, Leleup N. (MRAC 132646)

Other material examined

SOUTH AFRICA: 2 ♀♀, Transvaal, Lydenburg District, Ohrigstad, 24°50' S 30°20' E, 27 Mar. 1962, in forest litter, Leleup N. (MRAC 132641).

Description

Male (holotype)

MEASUREMENTS. Total length 5.47; carapace 2.84 long, 1.78 wide, narrowed to 0.92 in eye region.

COLOUR. Carapace (Fig. 6A) medium brown without silvery setae; chelicerae, sternum and posterior leg pairs brownish orange (Fig. 6B); anterior leg pairs yellowish orange; abdomen (Fig. 6A–B): dorsum and sides grey with complex pale pattern; venter pale with faint grey pattern, yellow in front of epigastric furrow; spinnerets yellow.

CARAPACE. Reticulated; flat, profile without dip. Chilum double, each sclerite 0.07 high, 0.07 wide; no setae. Sternum shield-shaped, 0.92 long, 0.71 wide.

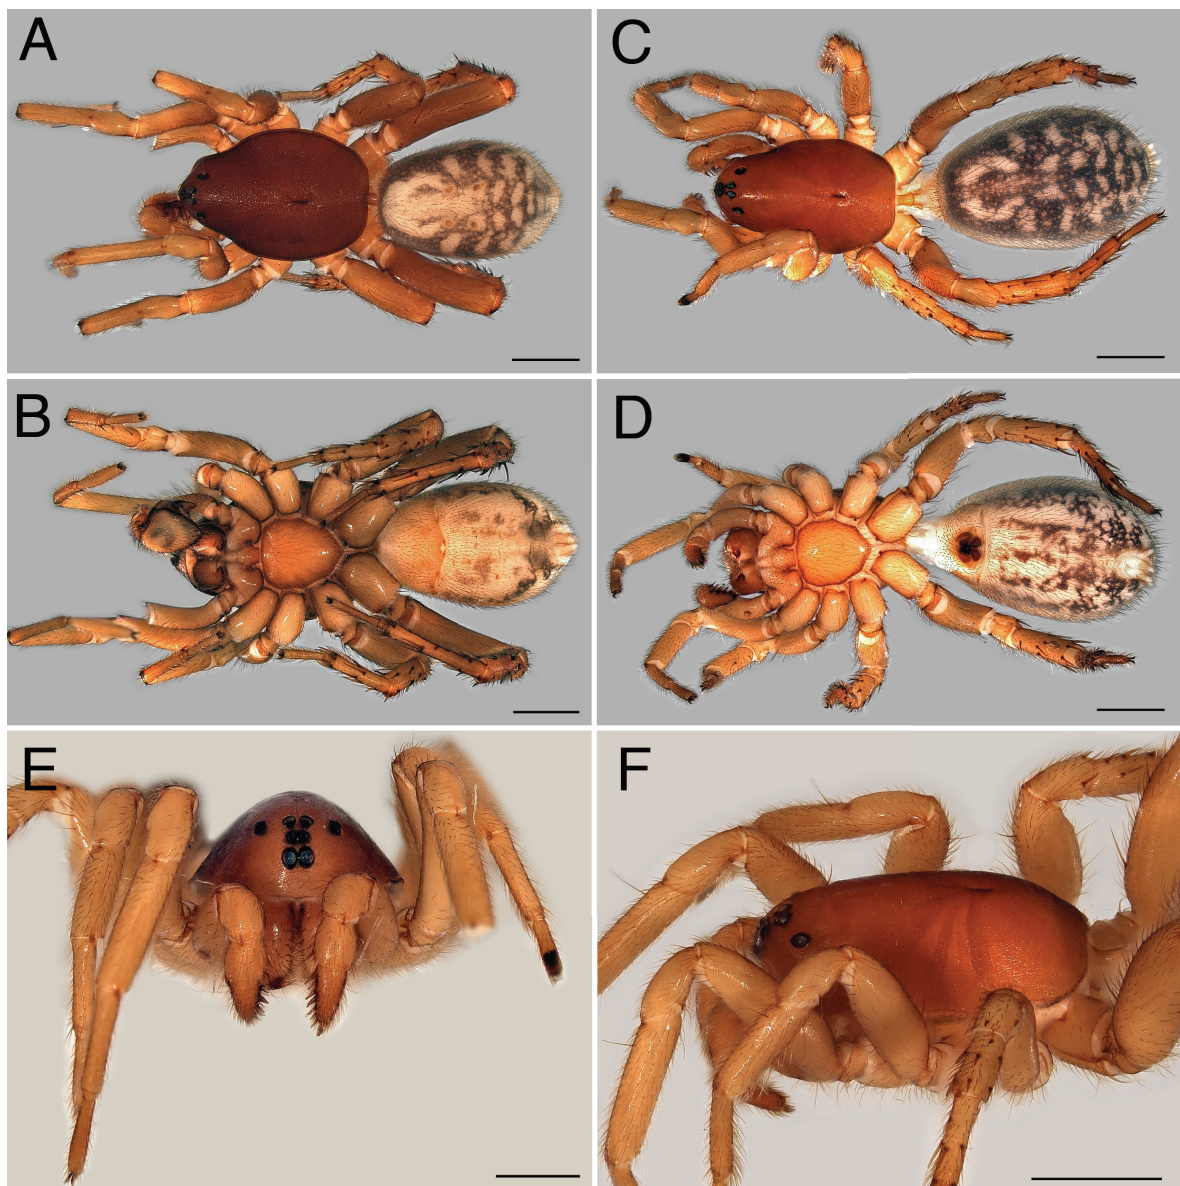

Fig. 6. *Ballomma haddadi* gen. et sp. nov. **A–B.** Holotype, ♂. **C–F.** ♀ (MRAC 132641). **A.** Habitus, dorsal view. **B.** As preceding, ventral view. **C.** Habitus, dorsal view. **D.** As preceding, ventral view. **E.** Prosoma, frontal view. **F.** Prosoma, dorsolateral view. IV	1.96	0.91	1.40	1.54	0.91	6.72

PALP (Fig. 6E). Claw with three small teeth; turned inward over $< 30^\circ$. Tarsus triangular with ventral side flat, provided with 10 prolateral, four retrolateral spines.

EPIGYNE (Figs 7C, 8C–D). Flat, poorly sclerotized area, with internal structure and cul-de-sac tubes visible in transparency.

Distribution

Known from the Limpopo Province in South Africa (Fig. 14).

Ballomma legala gen. et sp. nov.

urn:lsid:zoobank.org:act:83C81CDA-F2F9-4D16-B8D7-B7CA396043F5

Figs 9A–E, 10A–D, 14

Diagnosis

The female of *B. legala* gen. et sp. nov. is easily recognized by the dense field of spinules on the distal part of the endites and the epigyne with V-shaped mark in front of the transverse row of spermathecae. Also juveniles and subadult males have a field of spinules on the endites.

Etymology

The species name is a noun in apposition taken from the type locality.

Type material

Holotype

SOUTH AFRICA: ♀, Limpopo Province, Legalametse Nature Reserve, Balloon Forest Leg 01, 24°11.966 S 30°20.327 E, 17 Jan. 2009, riverine to mixed woodland, leaf litter sifting, N. Hahn (NCA 2015/3582).

Paratype

SOUTH AFRICA: 1 ♀, same data as holotype.

Remark

The tube contains four juveniles and three subadult males, most likely conspecific with the holotype.

Description

Female (holotype)

MEASUREMENTS. Total length 5.25; carapace 2.56 long, 0.92 high, 1.63 wide, narrowed to 0.98 in eye region.

COLOUR. Carapace (Fig. 9A, D) medium brown with thin dark margin; chelicerae medium brown; legs yellowish orange; and sternum yellow (Fig. 9B–C, E); abdomen (Fig. 9A–B, D): dorsum and sides

Fig. 9. *Ballomma legala* gen. et sp. nov. Holotype, ♀. **A.** Habitus, dorsal view. **B.** As preceding, ventral view. **C.** As preceding, frontal view. **D.** As preceding, lateral view. **E.** Mouth parts, ventral view. Scale bars: 1 mm.

with complex pale pattern on dark grey background; venter pale with three longitudinal bands of darker mottling; spinnerets yellow.

CARAPACE. Finely reticulate. Clypeus with dispersed setae. Endites with dense field of small spinules in distal half (Fig. 9E). With small crescent-shaped precoxal sclerite at coxae II and III.

EYES. AME: 0.09; ALE: 0.12; ALE–ALE: 0.0; AME–ALE: 0.04; PME: 0.09; PLE: 0.12; PME–PME: 0.03; PME–PLE: 0.15. Clypeus 0.23 or 1.7 times width of ALE; slightly retreating.

CHILUM. Double, each part 0.04 high, 0.12 wide. Sternum shield-shaped, 0.99 long, 0.85 wide.

LEGS. Hinged hair on T I and II; preening brush on II–IV poorly developed.

SPINATION.

IV	1.47	0.77	1.12	1.26	0.70	5.32

PALP. Tarsus triangular, slightly flattened ventrally, with row of prolateral short spines; claw with three teeth, not turned inward.

EPIGYNE (Fig. 10A–D). Roughly quadrangular; anterior ducts clearly visible, forming a V-shaped pattern, followed by transverse row of globular structures.

Distribution

Only known from the type locality in the Limpopo Province, South Africa (Fig. 14).

Ballomma neethlingi gen. et sp. nov.

[urn:lsid:zoobank.org:act:A55B7447-0792-4709-8ED2-E639C6B472A7](https://zoobank.org/urn:lsid:zoobank.org:act:A55B7447-0792-4709-8ED2-E639C6B472A7)

Figs 11A–E, 12A–C, 13A–C, 14

Diagnosis

The male of *D. neethlingi* gen. et sp. nov. is easily recognized by the field of spines in front of the epigastric fold and the palp with a retrolateral patellar swelling and a broad triangular transparent RTA. The female has a characteristic epigyne in which the ducts in transparency are in the shape of an X with a slight extension where upper and lower parts of X meet.

Etymology

The species name is a patronym for Jan Neethling a pseudoscorpion specialist and the collector of the holotype.

Type material**Holotype**

SOUTH AFRICA: ♀, Limpopo Province, Medike Mountain Reserve, 22°59'39" S 29°36'52" E, 8 Nov. 2012, montane bushveld, sifting litter, J.A. Neethling (NCA 2015/3484; ex MRAC 241635).

Paratype

SOUTH AFRICA: 1 ♂, Haenertsburg, 23°56' S 29°57' E, 5 Mar. 1976, under leaf, E. Hartwig (NCA 76/1048).

Other material examined

SOUTH AFRICA: 5 juveniles, same data as holotype.

Description**Male (paratype)**

MEASUREMENTS. Total length 7.53; carapace 3.34 long, 1.07 high, 2.20 wide, narrowed to 1.07 in eye region.

COLOUR. Carapace, sternum and chelicerae medium brown without silvery setae (Fig. 11A–C); chelicerae slightly darker at base than in distal half; legs pale yellowish brown; abdomen (Fig. 11A–B): dorsum

and sides pale with complex dark pattern on dorsum hidden by paler suffusion, provided with four dark apodemes; venter pale with complex dark pattern, yellow sclerotized area in front of epigastric fold; spinnerets pale yellow.

CARAPACE. Smooth (Fig. 11A), strongly narrowed in front; flat, fovea long, in shallow depression. Chilum double, each sclerite 0.05 high, 0.12 wide; no setae. Sternum shield-shaped, 1.35 long, 1.21 wide.

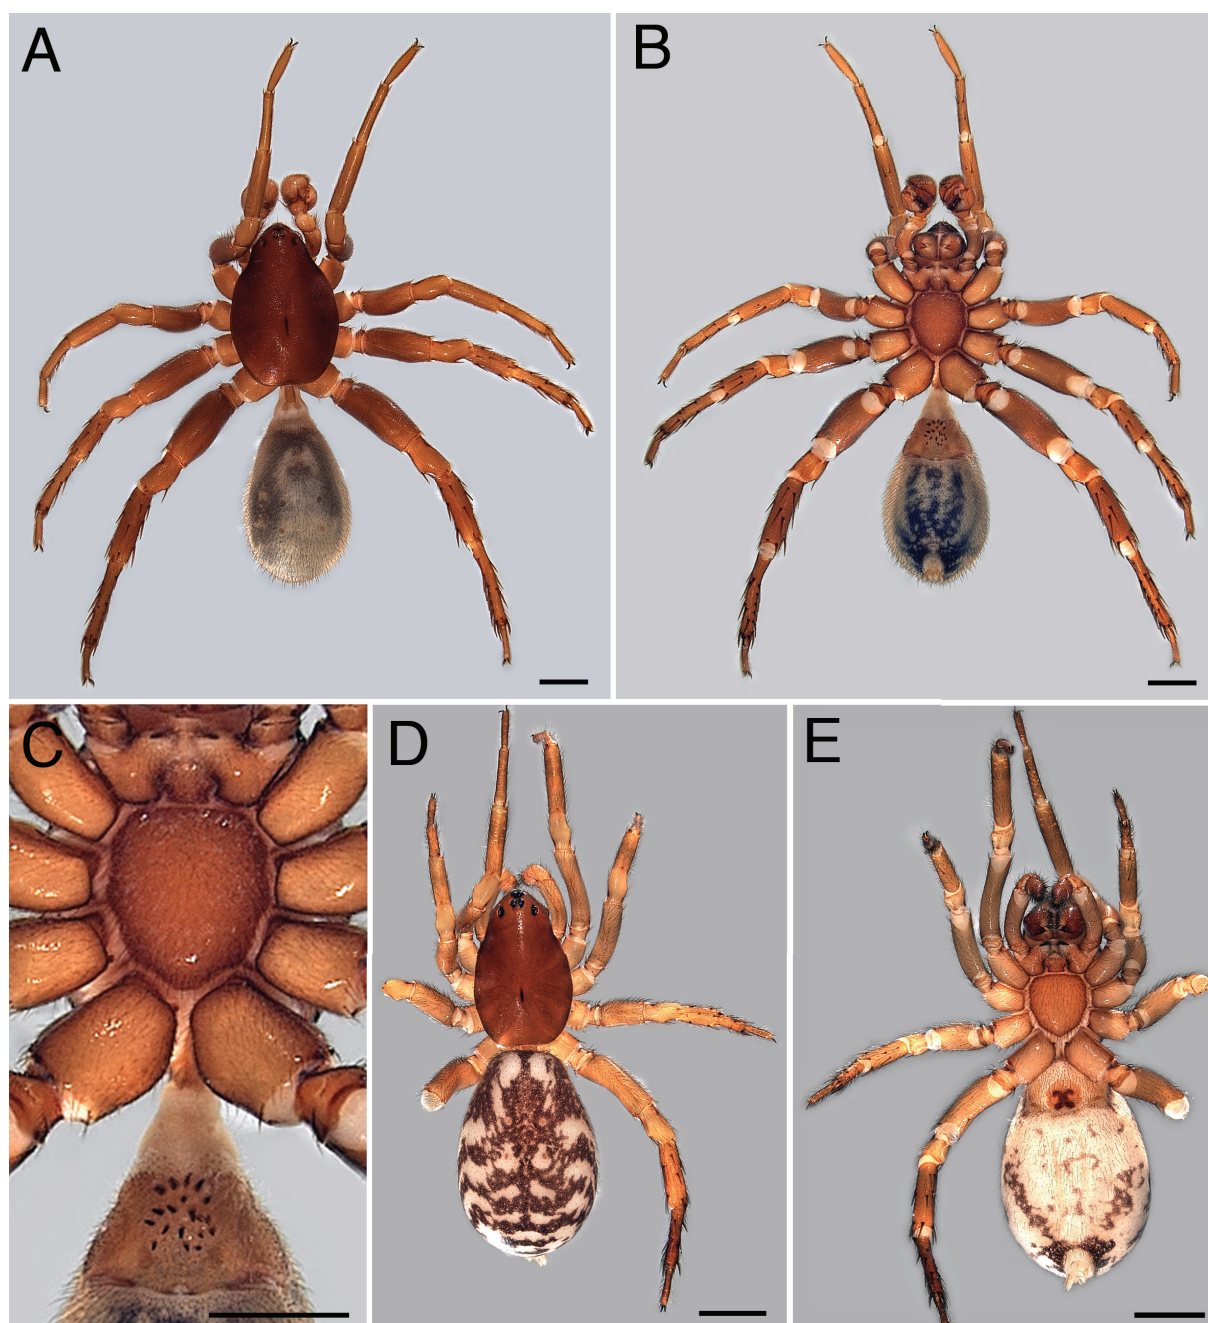

Fig. 11. *Ballomma neethlingi* gen. et sp. nov. **A–C.** Paratype, ♂ (NCA 76/1048) **D–E.** Holotype, ♀. **A.** Habitus, dorsal view. **B.** As preceding, ventral view. **C.** As preceding, detail. **D.** Habitus, dorsal view. **E.** As preceding, ventral view. Scale bars: 1 mm.

EYES. AME: 0.10; ALE: 0.13; ALE–ALE: 0.00; AME–ALE: 0.07; PME: 0.10; PLE: 0.13; PME–PME: 0.07; PME–PLE: 0.18. Clypeus 0.38 or 2.9 times width of ALE, retreating.

LEGS. Anterior tarsi fusiform; no hinged hairs.

SPINATION.

I	2.03	0.84	1.40	1.26	1.05	6.58
II	1.33	0.77	1.12	1.12	0.77	5.11
III	1.61	0.70	1.05	1.19	0.70	5.25
IV	1.75	0.70	1.47	1.75	0.91	6.58

ABDOMEN (Fig. 11A–B). Area in front of epigastric fold with 20 small spines. Spinnerets as for genus.

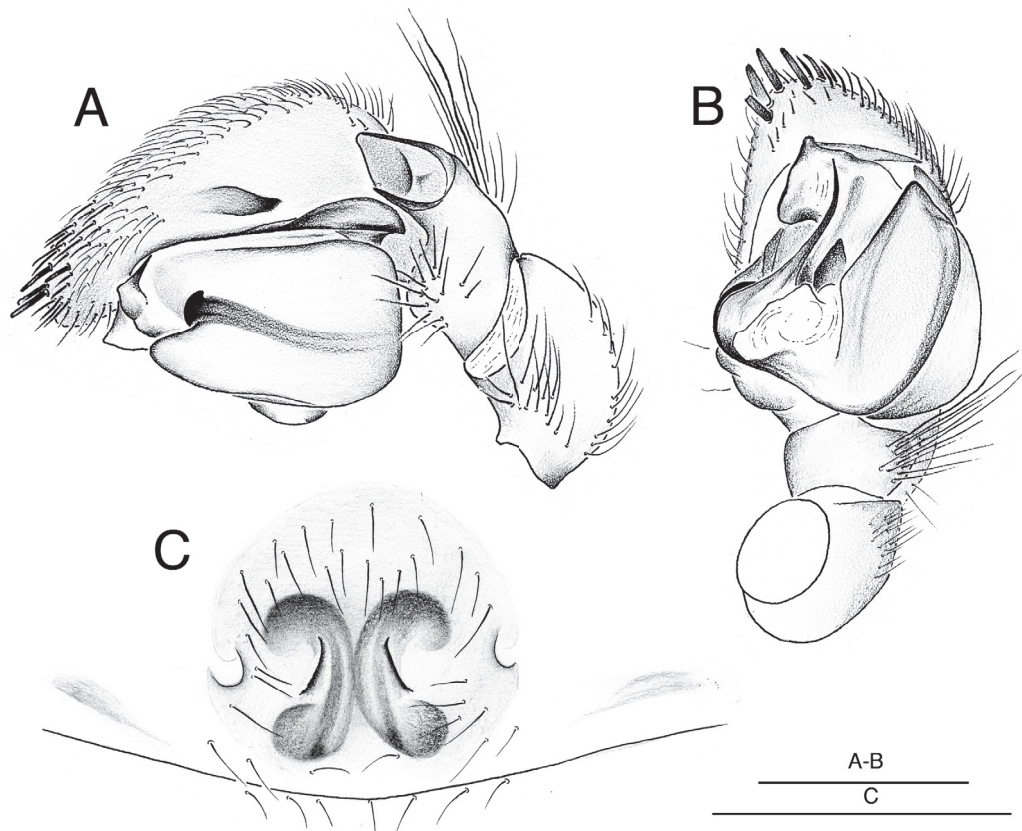

Fig. 12. *Ballomma neethlingi* gen. et sp. nov. **A–B.** ♂ (NCA 76/1048) **C.** Holotype, ♀. **A.** Male palp, retrolateral view. **B.** As preceding, ventral view. **C.** Epigyne, ventral view. Scale bars: 0.5 mm.

MALE PALP (Figs 12A–B; 13A–B). Patella with small haired ventrolateral swelling; tibia with clusters of hair on dorsal margin and on ventrolateral swelling; RTA roughly triangular, transparent, with rebordered dorsal margin; cymbium densely haired with eight truncated spines near tip; broad, basolateral, folded flange; subtegulum with three ridges and basal notch; tegulum with distoventral protrusion, prolaterally concave accommodating thin, slightly curved embolus; distal part of tegulum with dorsal quadrangular conductor.

Female (holotype)

MEASUREMENTS. Total length 5.75; carapace 2.41 long, 1.48 wide, 0.92 high, narrowed to 0.71 in eye region.

COLOURATION. Carapace, chelicerae and sternum brownish orange (Fig. 11D–E); legs brownish yellow; abdomen (Fig. 11D–E): dorsum and sides pale with complex dark pattern; venter pale with few dark spots; spinnerets pale yellow.

CARAPACE (Fig. 11D). Smooth, thinly haired; fovea in shallow depression. Clypeus with dispersed setae. Chilum double, each sclerite 0.07 high, 0.16 wide; no setae. Sternum shield-shaped, 0.99 long, 0.85 wide.

Fig. 13. *Ballomma neethlingi* gen. et sp. nov. **A–B.** Paratype, ♂ (NCA 76/1048) **C.** Holotype, ♀. **A.** Male palp, retrolateral view. **B.** As preceding, ventral view. **C.** Epigyne, ventral view. Scale bars: 0.2 mm.

EYES. AME: 0.07; ALE: 0.10; ALE–ALE: 0.0; AME–ALE: 0.0; PME: 0.07; PLE: 0.08; PME–PME: 0.03; PME–PLE: 0.16. Clypeus 0.21 or 3 times width of ALE.

LEGS. Hinged hair on TI and TII.

SPINATION.

IV	1.75	0.70	1.47	1.75	0.91	6.58

Palp with tarsus triangular and ventrally flat; provided with many prolateral and few retrolateral spines; pectinated claw turned inward over $> 30^\circ$.

Fig. 14. Distribution of species of *Ballomma* gen. nov.: *B. erasmus* gen. et sp. nov. (●), *B. haddadi* gen. et sp. nov. (■), *B. legala* gen. et sp. nov. (●) and *B. neethlingi* gen. et sp. nov. (●).

EPIGYNE (Figs 12C, 13C). Roughly rounded area with ducts visible in transparency forming X-shaped pattern, slight extension where top and bottom parts meet.

Distribution

Known from the Limpopo Province in the northern part of South Africa (Fig. 14).

Discussion

Most genera in the Zodariidae have a fairly large distribution area. This is partly due to the fact that the family has escaped far-reaching splitting. Genera do indeed remain largely subjective systematic levels and whether the species-groups are deeply split or not, makes an evident difference for their distribution. In general, genera are far too small (see Jocqué *et al.* 2013) thus obscuring patterns of evolution and distribution. But in the Zodariidae, most genera are fairly well delimited on the base of somatic characters which makes the grouping plausible and has prevented unnecessary splitting on the base of genitalic divergence (Jocqué 1990, 2009; Nzigidahera *et al.* 2011). Only genera with an apparent relictual distribution, like *Suffrica* Henrard & Jocqué, 2015, tend to have smaller distribution areas. This probably also applies to *Ballomma* gen. nov., which turns out to sit near the base of genealogic tree of the Zodariidae (unpublished). A prediction of the genus' distribution (Fig. 15) on the base of climatic data (DIVA-GIS 2011) expects a much larger distribution area than presently known in South Africa, overflowing in Botswana, Zimbabwe and Mozambique. Predictions on the base of climatic data for

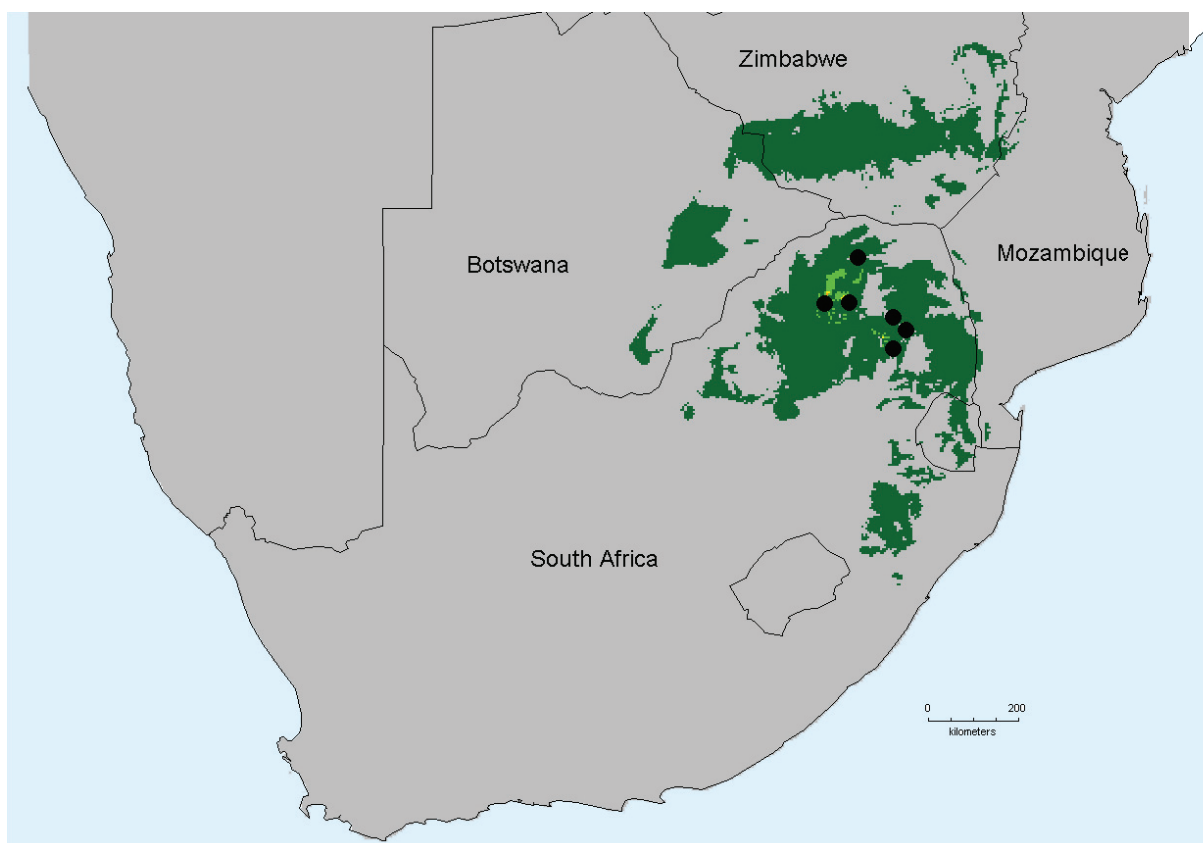

Fig. 15. Predicted distribution of *Ballomma* gen. nov. calculated in DIVA-GIS on the base of all climatic data as default in the software. Black dots present known localities of *Ballomma* gen. nov. Dark green areas have expected occurrence with the 5–95 percentile; pale green with 2.5–97.5 percentile.

other zodariid genera have shown that areas are sometimes largely overestimated because the calculation cannot take geographical barriers into account. *Mallinella* Strand, 1906, for instance, is expected to have a large area on Madagascar (unpublished data), but is not present there probably because it was unable to reach the island. The influence of geographical barriers is expected to be particularly important for those genera that occur in habitats that are likely to be disrupted like mountain forest which is apparently preferred by the species of *Ballomma* gen. nov.

Species with the anterior lateral eyes touching have so far only been found in *Ballomma* gen. nov. and in *Aschema*, endemic to Madagascar. The apparent endemism of *Ballomma* gen. nov. to a few highlands in the Limpopo Province and their affinities with endemics from Madagascar emphasizes the special character of these habitats and the fact that they are inhabited by taxa from old evolution lines. Further inventories of these montane forest patches might reveal the presence of more taxa representing old evolution lines and makes the study of these mountains a priority for the SANSA project.
