

Malaxidinae index nominalis – *Pseudoliparis* FINET, section *Pseudoliparis* (Orchidaceae)

H.B. Margońska*

Abstract

This part of the Malaxidinae index nominalis presents taxa of the type-section of genus *Pseudoliparis* FINET emend. SZLACH. & MARG., which is restricted to South East Asia and Oceania (Micronesia). One new nomenclatural combination on var. level and two new lectotypes are proposed. One new record within the genus is cited.

Key-words: *Crepidium*, *Liparis*, Malaxidinae, *Malaxis*, *Microstylis*, nomenclature, *Pseudoliparis*, section *Oistochilus*, Orchidaceae, section *Pseudoliparis*, taxonomy.

Zusammenfassung

Dieser Teil der Malaxidinae index nominalis präsentiert die Taxa von *Pseudoliparis* FINET emend. SZLACH. & MARG. section *Pseudoliparis*, die in Südostasien und Ozeanien (Micronesien) vorkommen. Eine neue Varietäts-Kombination und zwei neue Lectotypen werden vorgeschlagen, ein neuer Fund wird berichtet.

Introduction

The genus *Pseudoliparis* contains 41 taxa. Most of these orchids are known from very poor herbarium specimens or/and preserved liquid collections, occasional cultivation, some of them from type-specimens only. The knowledge about their ecology, phenology and real occurrence is very fragmentary, as well. The most distinguished *Pseudoliparis* features are mostly unique within subtribe Malaxidinae, e.g. colouration of flowers, morphology and ornamentation of lip and gynostemium, which resulted from adaptation to a specific kind of so far unknown pollinating insects.

The species occur in South East Asia, from Taiwan, Macronesia (particularly New Guinea and its islands) to Micronesia (e.g. Solomon Archipelago and Bougainville Islands) only.

Results and Discussion

Taxonomic history, problems and the characteristics of *Pseudoliparis* FINET (1907) were presented in a recently published part of Malaxidinae index nominum (MARGOŃSKA 2008). Infrageneric arrangement and taxonomic revision of the genus is nearly elaborated (MARGOŃSKA 2003a, 2003b, 2005, in prep.). There are two sections: the type-sec-

tion and section *Oistochilus*. The last one contains only 8 species, is easily distinguished by lack of any appendages or distinct convexity along the dorsal part of gynostemium column, and was already presented (MARGOŃSKA 2008).

Most of the species (33) belong to the type-section. The orchids are epiphytic, often terrestrial or sometimes and occasionally lithophytic species. They are mostly up to 30 cm high, with creeping, often elongate and branched rhizomes and distal, erect or ascending stems, finalised by an apical inflorescence. Similarly as in section *Oistochilus*, the type-section species flowers are mid size, somewhat fleshy, odourless to gently fragrant, with differently shaped petals (linear, lanceolate, elliptic, rhombic, obtuse, obovate, oblanceolate); usually with 1, rarely more veins or with laterally branched main veins; lip unlobed or only obscurely 3-lobed, always with entire margins, auriculate, flat (lack of basal cavity), ornamented at central part by parallel calli, lamellae or only obscure convexity.

The most characteristic features for the section are present of mostly horn-like appendage(s) or explicit convexity at the dorsal portion of the gynostemium column. Two localisations of the appendage(s) can be recognized: 1) about half or at upper half of the column length and 2) around the basal part of the column. There are two forms of the gynostemium staminodes, as well: (1) elongate, higher than the anther, simply, transversely truncate at distal margins; and 2) abbreviate, at similar length to the anther, with distal margins obliquely narrowed up to their apices. The anther is usually narrowly ovate to cordate, and stiffly fused with the column top, whereas the rostellum is similar sized and shaped to the anther, always erect and adnate to the top of the anther (MARGOŃSKA 2005).

The names in the index are given as:

bold italic – current name,

italic – published name

≡ homotypic taxon (based on the same type-specimens)

= heterotypic taxon (based on different type-collections); following – the citation is given, where the taxon was put into this synonymy first time.

Illegitimate and misunderstood names ("sensu") are given in normal letters. Herbaria are given with their abbreviations in Index Herbariorum (<http://sweetgum.nybg.org/ih/>).

"†" – the specimen has probably been lost during the Berlin disaster; "!" – the specimen has been seen.

Note: It is still possible that duplicates of Schlechter's collections exist, therefore no neotypes are chosen in all cases, when the only known type has been lost in Berlin.

Acknowledgments

I am especially grateful to Dr. G. Thijssse, the Curator of L, also the Curators of AMES, B, BM, BISH, BO, C (C-GS), FI, G, HBG, K, SING, US, WU and W (W-R), Z for the loan of herbarium specimens and/or their hospitality during my personal visits. I am obliged to the keepers of all visited scientific libraries, as well. Special thanks for Mrs. M.G. Kortylewska-Margońska and Mr. M. Margoński for help during my scientific works. The studies were conducted also with use of the database Archivum Orchidarium. This article was prepared thanks to Polish Ministry of Science and Higher Education grant No. N304 029 32/1584.
