agree mostly with the unique holotype of *N. choui* YUAN & WANG from Ningshan County, Shaanxi Province, but differ from the latter in having the discal band on both sides of hindwing broader and the white markings on both wings upperside more prominent. One of them has the discal band wider than in another specimen but narrower than in a ♀ of *N. mahendra* MOORE collected in the same locality (fig. 13). BOZANO (2008) stated that this species is hardly distinguishable from *N. soma* MOORE, 1858. However, after examining the specimens from Zhouqu County, I concluded that *N. choui* YUAN & WANG is more closely related to *N. mahendra* MOORE by having the pure white markings on both wings upperside in contrast to the creamy white markings in *N. soma* MOORE.
