

BRÄUERIA (Lunz am See, Austria) 20:26 (1993)

The caddisflies captured during the 7th International Symposium on Trichoptera, Umeå, Sweden, 3-8 August 1992.

Bo Gullefors, Section of Entomology, Department of Zoology, Uppsala University, Box 561, S-751 22 Uppsala, Sweden.

On the excursion, Wednesday 5 August 1992, along the Umeälven River and the Vindelälven River many caddisflies and larvae were collected. Five participants sent me the lists of their captures. The recorded captures of adults, including my own, are noted below.

In total 1669 specimens comprising 48 species were recorded (Tab. 1). The Leptoceridae dominated with 16 species followed by Limnephilidae with 10. As expected, the smallest number of species and specimens were captured along the regulated Umeälven river, viz. 382 specimens representing 29 species. However, the most interesting finding was 13 specimens of *Oecetis notata*, which were collected on an UV-lightened window of a flower shop at the center of Umeå. Two males were also recorded at the Stornorrforss Power Station. *O. notata* is a new record of the province of Västerbotten. It has earlier been found in the province of Dalarna 400 km south of Umeå (Forsslund and Tjeder 1942), but also at Rovaniemi in Finland 400 km north of Umeå (Nybom 1960). Other new records from the province of Västerbotten include *Limnephilus marmoratus*,

*Molanna albicans* and *Oecetis testacea*. All these were expected and also the new record, *Athripsodes albifrons*, for Lycksele Lappmark.

Along the unregulated Vindelälven River more caddisflies were collected from four different places. In total 1287 specimens belonging to 37 species were recorded.

*Athripsodes commutatus* (753 inds.) was the most common species along both rivers, and most of them were netted along the bank close to the landing place of the rafts.

The recorded number of the caddisfly species in the province of Västerbotten has now increased from 145 to 148, and in the province of Lycksele Lappmark to 123 (Gullefors 1988).
