New faunistic records of Trichoptera in Greece II

Ioannis KARAOUZAS

Abstract: New faunistic data on Trichoptera collected from 2012 - 2019 throughout Greece are presented. Noteworthy is the finding of *Tinodes kadiellus* in South Euboea, previously only recorded from Rhodes Island, a distance of 372 km. *Sericostoma flavicorne* is new for the fauna of Kerkira (Corfu), *Hydroptila aegyptia* is new for Serifos, genus *Hydropsyche* and *Wormaldia* are new for the island of Skopelos. Several other species are new regional records.

Keywords: biogeography, caddisflies, distribution, endemic, islands, taxonomy.

Introduction

The Trichoptera fauna of Greece is represented by 315 species (12 subspecies) of which 73 are endemic (MALICKY 2005; KARAOUZAS & MALICKY 2015; NEU et al. 2018; MALICKY 2022). Overall, the caddisfly fauna of Greece is well known, but due to the complex geomorphology of the country, resulting to a wide variety of habitats, (i.e. islands, remote mountainous areas, springs, lakes, temporary ponds) many areas are still unexplored. Since the latest publication by KARAOUZAS & MALICKY 2015, where a significant amount of new trichopterological data has been presented, new species, new localities and new records have been established for several species, some of them being among the rarest representatives of Trichoptera in this country. In this contribution, caddisfly data collected by the first author from 2012-2019 are presented, giving new insights of the caddisfly distribution in Greece.

Rhyacophila balcanica RADOVANOVIĆ 1953
