

## Ecological note on *Sonchus bourgeauui* on Fuerteventura

Dietmar Brandes (TU Braunschweig)

*Sonchus bourgeauui* Sch.Bip. is a little known species of the subgenus *Sonchus*. It is mentioned in the recent floras of the Canary Islands for Fuerteventura, Lanzarote and Gran Canaria (KUNKEL 1977, HOHENESTER & WELß 1993, SCHÖNFELDER & SCHÖNFELDER 1997, ACEBES GINOVÉS ET AL. 2001). The species has two varieties: var. *bourageauui* (Fuerteventura, Lanzarote, Gran Canaria?, and Morocco), and the endemic var. *imbricatus* (Svent.) Boulos (Gran Canaria and Lanzarote).

Fig. 1: *Sonchus bourgeauui* (old road from Lajares to El Roque (Fuerteventura, Feb. 2005).

*Sonchus bourgeauui* var. *borgeauui* is one of the few annual species of the genus *Sonchus* on the Canary Islands. It is related to *Sonchus oleraceus*, *Sonchus tenerrimus*, and *Sonchus microcephalus*. *Sonchus bourgeauui* var. *borgeauui* is distinguished by its larger flower heads, their deep yellow colour and the dense lanate hairs below the capitula. The outer involucral leaves of the flower heads are densely covered with glandular hairs.

Recent karyological studies have shown that the above mentioned species are characterized by dysploidy (MEJIAS & ANDRES 2004). Whilst the basic chromosome number is  $n = 9$ , the chromosome numbers of *Sonchus bourgeauui* and *Sonchus tenerrimus* are  $n = 8$  resp.  $n = 9$ .

Fig. 2: *Sonchus bourgeauui* with *Chrysanthemum coronarium* var. *discolor*, *Reichardia tingitana* and *Patellifolia patellaris* (roadside e. Lanjares, 24.2.2005).

*Sonchus bourgeauui* is locally common on roadsides in the vicinity of Lajares and also of Vega de Río Palmas. It dominates the vegetation in small loamy depressions accompanying the roads (tab. 1). Most stands belong to the Chenopodio muralis-Malvetum parviflorae, as indicated by *Patellifolia patellaris*, *Chenopodium murale*, and *Malva parviflora*. There are transitions to other ruderal syntaxa like Iflogo spicatae-Stipetum capensis, Mesembryanthemetum crystallini or Hordeion leporini (e.g. stands with *Chrysanthemum coronarium* and *Hordeum murinum* s.l.).

Tab. 1: Stands with dominating *Sonchus bourgeau* on Fuerteventura.

---

No. 2115-2122: roadsides between Lajares and El Roque; No. 2145-4148: roadsides and slopes near Vega de Río Palmas (february 2005).

The situation on Lanzarote is similar, but not the same: *Sonchus bourgeauui* is a character species of the Bromo-Hirschfeldietum incanae (*Hordeion leporini*) according to REYES-BETANCORT, WILDPRET DE LA TORRE & LEÓN ARENCIBIA (2001). *Sonchus bourgeauui* was found also growing in other types of annual ruderal vegetation and also in dwarf herbage:

Hordeion leporini:  
Euphorbio terracinae-Anacycletum coronati (frequency class I),

Chenopodium muralis:  
Chenopodio muralis-Malvetum parviflorae (frequency class II)

Carrichtero-Amberboion lipii:  
Ifloga spicatae-Stipetum capensis (frequency class II)

Helianthemetea guttati:  
Hypochoeridi glabrae-Tuberarietum guttatae (frequency class I)
