

STUDIEN ZUR PLECOPTERENFAUNA DES SEEBACHES (RITRODAT - LUNZ)

Christian Stummer

Die Studien zur Plecopterenfauna des Seebaches wurden als Vorbereitung für eine Dissertation (Arbeitstitel: Abundanz, Verteilung und Dynamik der Larven von Plecopteren-Populationen RITRODAT - LUNZ) durchgeführt.

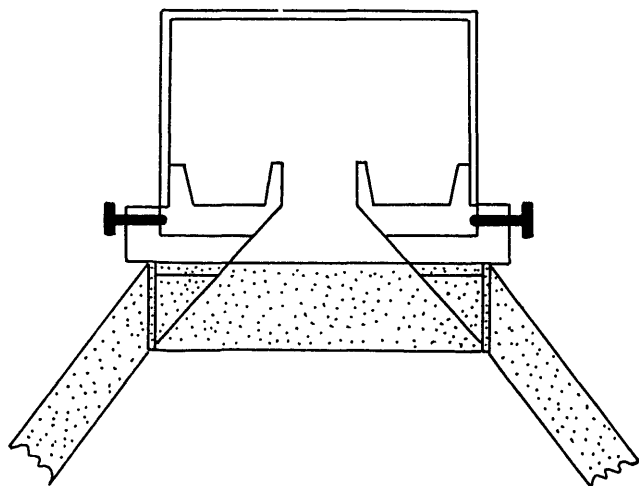

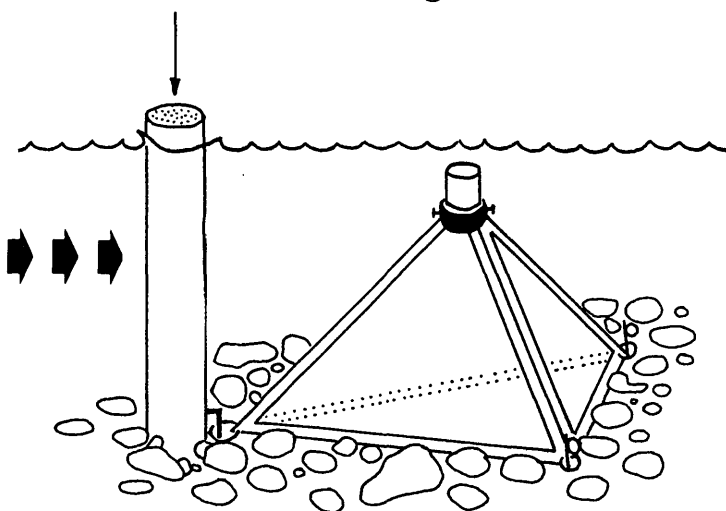

Der Aufbau dieser Dissertation ist folgender:

Die Emergenz wurde vorerst mit Hilfe herkömmlicher Schlüpftrichter untersucht.

Seit dem 9. April 1979 ist eine etwas modifizierte Form von Schlüpftrichter in Erprobung, welcher eine gute Fängigkeit für Plecopteren (Imagines und schlüpfreife Larven) aufweist und gegen Hochwasser relativ unempfindlich ist (Zeichnung).

Lärchenrundling zum Brechen der Strömung

Schnellwechsel - Fanggefäß

Anhand der Emergenz und noch durchzuführender Zuchten soll eine Rückbestimmung der Larven erfolgen und eine oder zwei quantitativ häufige Arten, die möglichst bis zu sehr frühen Stadien bestimmbar sein sollten, werden zu einer autökologischen Studie herangezogen.

Die Arbeit begann nach Abschluß des Studiums an der Universität Salzburg (Zoologie/Botanik) im Februar 1979.

Neben der Arbeit an adulten Tieren wurde auch Plecopterenmaterial anderer Aufsammlungen (Bretschko, Jahresbericht 1977:17-45) untersucht und soweit gegenwärtig möglich bestimmt.

Parallel dazu wurden weitere Proben mit einem Surber-Sampler entnommen. Seit dem 22. Mai 1979 sind auch neue Sedimentfallen in Erprobung, mit welchen eine quantitative Probenentnahme möglich sein sollte.

Bisher konnten folgende Arten bestimmt werden (noch nicht kontrolliert!):

| | |
|----------------------------|--------------------------------|
| <u>Leuctra handlirschi</u> | <u>Nemoura mortoni</u> |
| L. <u>braueri</u> | <u>Amphinemura sulcicollis</u> |
| L. <u>albida</u> | <u>Perla maxima</u> |
| <u>Perlodes intricata</u> | <u>Isoperla oxylepis</u> |
| <u>Isoperla grammatica</u> | <u>Chloroperla tripunctata</u> |

Für die Bereitschaft, meine Bestimmungen zu kontrollieren, danke ich Herrn Dr. Peter Zwick, Limnologische Station Schlitz.

Das vorliegende Material aus den "Untersuchungen zur vertikalen Verteilung der Bachfauna in den Sedimenten des Bachbettes" aus dem Jahre 1977 wurde im Hinblick auf signifikante Größenunterschiede in verschiedenen Tiefen untersucht.

Um die Probenzahl zu erhöhen, wurden drei Besammlungsabschnitte zusammengefaßt:

Abschnitt I 18.7.-25.7.1977

Abschnitt II 17.8.- 7.9.1977

Abschnitt III 20.9.- 5.10.1977

Abschnitt I umfaßt eine Probenserie, Abschnitt II fünf und Abschnitt III acht Serien.

Ausreichendes Material für eine statistische Überprüfung war bei *Leuctra* sp. sp. und bei den ganz kleinen Larven, die nur als Plecoptera anzusprechen sind, vorhanden.
