Abstract

Studies on the increase in top height were carried out in 67 mature stands of pine growing under various natural conditions of Poland. It was found that stands attaining the same top height at the age of 100 years may reveal different course of height growth. Three growth types were identified: Typ I - with growth accelerated during juvenile period and lowered in older age; Typ II - with normal (average) growth; Typ III - with growth inhibited during juvenile period and accelerates in an older age.
