## Antheraea (Antheraea) platessa ROTHSCHILD 1903: The correct name for Antheraea jana auctorum, nec STOLL 1782 (Lepidoptera: Saturniidae)

by

Wolfgang A. Nässig<sup>1</sup>

Abstract: The name Attacus jana STOLL 1782 was misinterpreted for at least a century. STOLL's illustration figures a specimen of the complex of species that includes Antheraea frithi MOORE 1858, A. celebensis WATSON 1915, and related taxa, but clearly not the species called "jana" by authors. The correct name for the latter taxon is Antheraea (Antheraea) platessa ROTHSCHILD 1903, stat. rev. (nec platesse, misspelling), with fusca ROTHSCHILD 1903 (lectotype  $\mathfrak{P}$  designated) in synonymy (n. syn.).

### Antheraea (Antheraea) platessa ROTHSCHILD 1903: der gültige Name für Antheraea jana auctorum, nec STOLL 1782 (Lepidoptera: Saturniidae)

**Zusammenfassung:** Der Name Attacus jana STOLL 1782 wurde für über ein Jahrhundert fehlinterpretiert. STOLLs Abbildung zeigt einen Falter aus der Gruppe von Arten um Antheraea (A.) frithi MOORE 1858 und A. (A.) celebensis WATSON 1915, nicht jedoch die Art, die von späteren Autoren "jana" genannt wurde. Der gültige Name für diese Art ist Antheraea (Antheraea) platessa ROTH-SCHILD 1903, stat. rev. (nicht platesse, falsche sekundäre Schreibweise), Typenfundort Burma, mit fusca ROTHSCHILD 1903 (Typenfundort Borneo, Lectotyp  $\varphi$  designiert) in Synonymie (n. syn.). Die echte A. (A.) jana STOLL tritt innerhalb der frithi/celebensis-Gruppe neu in die Synonymie ein; eine Klärung der Verhältnisse dort sei einer späteren Revision vorbehalten.

<sup>1: 24&</sup>lt;sup>th</sup> contribution to the knowledge of the Saturniidae.

### Introduction

During studies on the Sumatran species of the family Saturniidae in preparation of the family treatment in the series "Heterocera Sumatrana" (HS), the author discussed several taxonomic problems with his colleagues and friends Jeremy D. HOLLOWAY, London (CAB International Institute of Entomology), Richard S. PEIGLER, Denver (Denver Museum of Natural History), and especially Claude LEMAIRE, Gordes, France. During these discussions, especially during studies of the illustration by STOLL (1782) (Fig. 1), conducted by C. LEMAIRE and the author, the identity of the nominal taxon *jana* STOLL 1782 turned out to be misinterpreted. The results of these studies are published here prior to the family treatment within the "Heterocera Sumatrana" series to make the results of the studies available for other workers. Publication of the HS series is currently delayed by financial limitations.

The author grateful acknowledges the kind support by and discussion with Jeremy D. HOLLOWAY, Claude LEMAIRE, Richard S. PEIGLER and the coauthors of the forthcoming HS treatment, Rudolf E. J. LAMPE and Stefan KAGER, Nürnberg. The manuscript was critically reviewed by Konrad FIEDLER, Würzburg, and Richard S. PEIGLER. David GOOD-GER, The Natural History Museum, London, kindly took photographs of the types.

Antheraea (Antheraea) platessa ROTHSCHILD 1903, stat. nov.

(= jana auctorum, nec STOLL 1782)

Antheraea jana platessa ROTHSCHILD 1903, Novit. Zool. 10: 311.

Holotype (by monotypy)  $\sigma$  in The Natural History Museum (BMNH), London (examined) (Fig. 2). locus typicus: Burma

Antheraea jana platesse [sic] ROTHSCHILD: SCHÜSSLER (1933: 179), misspelling (This misspelling is also widely in use in museum catalogues.)

Synonym: fusca ROTHSCHILD 1903, Novit. Zool. 10: 311, n. syn. Syntypes  $(2 \ \mathfrak{P}^2)$  in BMNH, London (examined) The female figured here (Fig. 3) is herewith designated as lectotype. locus typicus: Borneo

<sup>&</sup>lt;sup>2</sup>: There is only one specimen in BMNH labelled as a syntype; this one is figured here and designated lectotype; it already has an old handwritten type label. There are two more  $\mathfrak{PP}$  in BMNH which might be syntypes (making a total of 3  $\mathfrak{PP}$ , although ROTHSCHILD explicitly wrote of only 2  $\mathfrak{PP}$ ); as both of them are not labelled as such. I did not decide which one to be the second syntype.

Antheraea jana fusca ROTHSCHILD: ALLEN (1981: 117); LAMPE (1984: 11, 1985: 13)

Antheraea jana CRAMER [sic]: BARLOW (1982: 50)

Antheraea jana Stoll: Holloway (1987: 101); PINRATANA & LAM-PE (1990: 17); PAUKSTADT & PAUKSTADT (1991: 20).

**Geographical range:** A. (A.) platessa ranges from<sup>3</sup> Burma, Thailand (PINRATANA & LAMPE 1990), and northern Vietnam (leg. J. RAZOWSKI, Polish Academy of Sciences, Krakow, in coll. NÄSSIG) to Sundaland (BARLOW 1982; ALLEN 1981; LAMPE 1984, 1985) and the Philippines (TREADAWAY, pers. comm.) and possibly Sulawesi (PAUKSTADT & PAUK-STADT 1991). The status of the closely related A. (A.) andamana (Andaman Islands) remains to be proven, see taxonomic notes.

**Taxonomic notes:** Although this species was called A. jana by practically all authors since the late  $19^{th}$  century, the name jana (Attacus jana STOLL 1782, in CRAMER, Uitl. Kap. 4: 220, pl. 396) is not applied correctly to it. The painting in STOLL's original description (Fig. 1) shows a very pale yellowish specimen with large eyespots with a hyaline centre, a whitish triangle from the costa to the eyespot of the forewing, and especially a straight outer fascia (postmedial and submarginal fascia obviously fused) on the forewing; what has been called "A. jana" always has a wavy outer fascia (at least the postmedial, sometimes also the submarginal fascia). (The extension of the apical spot is variable in both groups.) STOLL's type of A. jana is probably lost (type locality: Java). Nevertheless, this specimen is clearly a member of the frithi/celebensis complex and not identical with platessa. Contrasting specimens like the one figured by STOLL are rare, but I have two similar specimens from Bali (Fig. 4) in my collection.

The incorrect use of the name jana was already assumed by HOLLO-WAY (1987). His suggestion to maintain stability and designate the holotype of A. (A.) andamana MOORE 1877 (Proc. Zool. Soc. London 1877: 602; in BMNH) as neotype of jana STOLL is not recommended by the Code (ICZN 1985, Article 75 (d) (5)): a neotype must, if possible, come from the same locality as the lost holotype. Therefore, regrettably, the traditional use of the name jana must be changed. Further, it seems likely that the Andaman species A. (A.) andamana is distinct from the continental platessa; the female type of Antheraea frithi insularis WATSON 1914 (Ann. Rep. Trans. Manchester Entomol.

<sup>&</sup>lt;sup>3</sup>: In BMNH there are a few specimens from North India, Assam, which may belong to A. (A) platessa as well; these differ slightly from the Burmese and Thai specimens.

**Figs. 1 & 2: Fig. 1:** Illustration of *Attacus jana* STOLL. (Phot. C. LEMAIRE ex lib. C. LEMAIRE.) **Fig. 2:** Holotype  $\sigma^{n}$  of *Antheraea jana platessa* ROTHSCHILD (in BMNH). (Phot. D. GOODGER, BMNH.)

Figs. 3 & 4: Fig. 3: Female syntype of Antheraea jana fusca ROTHSCHILD (in BMNH) (here designated as lectotype). (Phot. D. GOODGER, BMNH.) Fig. 4: Specimen of a species in the frithi/celebensis complex similar to STOLL's figure from Indonesia: Bali, Candi Kuning, 1200 m, 13./14. i. 1989, leg. D. & S. KOVAC, in coll. W. A. NXSSIG. (Phot. W. A. NXSSIG.)

Soc. 1913: [without page numbers]; in BMNH), which is a colourful yellowish specimen, appears to be a female colour variant of andamana. Such yellowish forms are unknown in the continental and Sundanian platessa. Therefore I tentatively consider Antheraea (A.) andamana to be a distinct, though closely related, species.

The name *jana* now enters into synonymy in the *frithi/celebensis* group; it may later possibly replace the name *surakarta* MOORE 1862 as the oldest available name of the group from Java. I do not intend to change anything here prior to a revision.

The placement of the species *platessa* within the subgenus Antheraea (Antheraea) (most likely in the same subgroup of the paphia/frithigroup as the frithi/celebensis complex, i.e. in the frithi-subgroup) follows NÄSSIG (1991), who divided the extensive genus Antheraea HUB-NER [1819] into three subgenera: A. (Antheraea HUBNER [1819]), A. (Telea HUBNER [1819]), and A. (Antheraeopsis WOOD-MASON 1866), based on larval and  $\sigma$  genitalia morphology.

ROTHSCHILD described another Antheraea taxon in the same issue of Novitates Zoologicae: Antheraea jana fusca (Novit. Zool. 10: 311; type locality Borneo). As this taxon is based on two female syntypes (examined, in BMNH; see footnote 2) I preferred to select platessa as the valid name (first reviser's choice; new synonymy) to fix the identity without doubt. The identity of a female is usually more difficult to determine with certainty in Antheraea (Antheraea). On the basis of present knowledge, I do not think that there are valid subspecies in A. (A.) platessa, although there seems to be some (clinal?) geographical variation. The conspecifity of ROTHSCHILD's taxa is not in doubt. The syntype of fusca figured here (Fig. 3) is designated as lectotype.

**Diagnosis:** Males of A. (A.) platessa can best be identified by the strongly developed dark medial band of the forewing, the wavy outer fascia (especially the postmedial fascia), and the contrastingly yellowish apical triangle, females by the strongly wavy outer fascia and the ground colour, which is always brighter than, but similar to that of the males. It is likely that the female specimen figured by ALLEN (1981: pl. 14) is in fact a female of another species in the *frithi*-subgroup, not that of A. platessa. HOLLOWAY'S (1987) plate 7, fig. 14 shows a very reddish female, but this specimen seems to be a real A. platessa, as far as we know presently. The females figured by BARLOW (1982) and LAMPE (1984, 1985) are surely true A. platessa.

The species A. platessa is on average much less variable than other members of the *frithi*-subgroup (the ground colour is always brownish,

not yellow, orange, or red); bright specimens may be bleached by light.

**Biology:** Unknown. The species is generally rare and has evidently not been reared in captivity. Ova (and often specimens) sent to Germany by Dr E. W. DIEHL from Sumatra and expected by him to be "Antheraea jana" (= A. platessa) always turned out to be different species, generally A. (A.) gschwandneri NIEPELT 1918, a species of the frithi/celebensis complex which can easily be confounded with A. (A.) platessa on Sumatra, especially in the female sex.
