Accepted 15. 1. 2013

**Key words:** *Battarrea phalloides*, gasteroid fungi. – New record. – Mycobiota of Saudi Arabia.

**Abstract:** *Battarrea phalloides* was observed for the first time in Saudi Arabia from Bani Amer valley, Baljurashi county, Al Baha province. The species grew in sandy soil in association with *Ziziphus* trees. In the soil of the collection site the organic matter varied from 3.57-10.6% in soil depths between 10-25 cm.

**Zusammenfassung:** *Battarrea phalloides* wurde erstmals für Saudi Arabien im Bani Amer Tal im Bezirk Baljurashi in der Provinz Al Baha beobachtet. Die Pilzart wuchs in sandigem Boden bei *Ziziphus*-Bäumen. Am Fundort variierte der Gehalt an organischem Material von 3,57-10,6 % in Bodentiefen zwischen 10-25 cm.

Gasteroid fungi include puffballs, earthstars, stinkhorns, bird's nest fungi, false truffles, and gasteroid agarics. Gasteroid agarics often develop underground and appear epigeous only when the sterile portion elongates so that at the mature spores may be dispersed (LIU & FAN 2006).

*Battarrea* is considered as belonging to the *Agaricaceae* (RAUSCHERT 1986, KIRK & al. 2008). The young basidiomata are hypogeous and spherical. During maturity the scaly and hollow stipe is expanding, the exoperidium remains basally as a volva and apically as scales on the endoperidium. The endoperidium dehisces circular and degenerates apically, thereby exposing the spores.

Here we report *Battarrea phalloides* (DICKS.) PERS. for the first time for Saudi Arabia.

### **Materials and methods**

**Locality and collection examined:** Saudi Arabia, province Al Baha, Baljurashi, 19° 51' 34" N, 41° 33' 26" E, Ben Amer valley, mountain range of al-Sarawat (al-Sarat), ca. 2000 m s. m., in sandy soil, close to *Ziziphus spina-christi* trees, December 2011, leg. SAAD HOWLADAR, YEHIA A.-G. MAHMOUD, and AHMED MERISEEL. The specimen is deposited in the Mycological Herbarium at Al Baha University in the Department of Biology, Faculty of Science, Saudi Arabia.

**Soil organic matter determination:** Soil organic matter content was estimated according to the modified method of WALKLEY & BLACK as described by JACKSON (1973). Five mg of soil weight was used for organic matter content analysis and analysed at the Central Laboratory for Soil, Water & Plant Analysis (CLSWPA), Faculty of Agriculture, Fayoum University, Egypt.

---

\*Permanent address: Tanta University, Faculty of Science, Botany Department, Mycology Research Lab., Tanta 31527, Egypt.

**Identification:** The species was identified with classical morphological characters following SINGER (1962), MOSER (1978), ARORA (1986), CASTELLANO & al. (1989), TURNER & SZCZAWINSKI (1991), JORDAN & WHEELER (1995), and MARTÍN & JOHANNESSEN (2000).

## Results

### Chemistry of the soil

Organic matter in soil samples from which *Battarrea phalloides* was collected ranged between 3.57 % and 10.60 % at soil depths between 10-25 cm (Table 1).

Table 1. Organic matter percentage in different depths of soil from which *Battarrea phalloides* has been collected.

| Sample No. | Depth (cm) | Organic matter (%) | Sample No. | Depth (cm) | Organic matter (%) |
|------------|------------|--------------------|------------|------------|--------------------|
| 1          | 10         | 3.57               | 8          | 20         | 9.06               |
| 2          | 10         | 5.74               | 9          | 13         | 8.97               |
| 3          | 20         | 4.28               | 10         | 17         | 10.61              |
| 4          | 25         | 6.49               | 11         | 12         | 7.57               |
| 5          | 15         | 3.97               | 12         | 12         | 7.14               |
| 6          | 20         | 8.88               | 13         | 20         | 6.13               |

### Description of the Saudi Arabian collection of *Battarrea phalloides* (Fig. 1)

#### Characters:

**Basidiomata:** developing rapidly, mature rust-colored, young hypogeous and spherical with thick peridium (Fig. 1 d), older epigaeous, stipe expanding up to 40 cm (16 in) length and 0.4 to 1.6 cm (0.2-0.7 in) width and bearing the spore sack (Fig. 1 a-c).

**Stipe:** inner layer of the stipe consisting of arranged closely (almost parallel) strings, outer layer thicker, membranous, sometimes with corky fabric when dry, and dirty white.

**Exoperidium:** basally remaining as a volva and apically as scales on the endoperidium.

**Endoperidium and spore sack:** hemispherical to conical, 1.0-2.8 cm (0.4 to 1.3 in) in diam., later splitting circular along the equator and deteriorating (Fig. 1 c).

**Stipe plectenchyma:** with some clamp connections on the border between inner and outer layer.

**Gleba:** consisting of capillitium and elaters.

**Capillitium hyphae:** thin-walled, mostly septate, smooth, little branched, hyaline to pale yellow, with clamp-connections up to 5 µm in diam.

**Elaters:** 32-80 µm long and 3.5-7.0 µm wide, pale yellow, walls smooth, tapering and bearing spiral thickenings.

**Basidiospores:** thick walled, rusty brown, finely warted, 5.0-6.5 µm in diam.

Fig. 1. a-c. Mature basidiomata of *Battarrea phalloides*, d. young basidioma developing underground.

**Endoperidium hyphae:** densely interlocking, 3-9 µm in diam., thin-walled, walls less than 1 µm thick, septate, branched, pale yellow, with clamp connections.

**Ecology and habitat:** In Saudi Arabia *Battarrea phalloides* grew solitary and scattered in dry, sandy soils in the desert mostly along hedge banks. It occurred with alive or dead parts of the following plants: *Acacia gerrardii* var. *iraquensis*, *Acacia*, *Argemone ochroleuca*, *Asphodelus fistulosus*, *Barbeya oleoides*, *Centaurea sinaica*, *Commiphora quadricincta*, *Cordia africana*, *Ephedra alata*, *Euclea schimperi*, *Faidherbia albida*, *Juniperus excelsa*, *Lavandula pubescens*, *Nepeta deflersiana*, *Otostegia fruticosa*, *Phlomis* spec., *Populus euphratica*, *Psiadia punctulata*, *Pulicaria crispa*, *Salvia multicaulis*, *Solanum incanum* and *Ziziphus spina-christi*.

## Discussion

**Ecology:** *Battarrea phalloides* is a terricolous saprobic species, decomposing rotten leaves or other organic matter, occurring in warm-temperate, Mediterranean to tropical climate, on sandy and clay soils, in deserts, semideserts, steppes, or ruderal sites, in dry clear forests, often under trees in shade, sometimes on woody debris or sawdust, fruiting in all seasons (KREISEL 2001, GIBSON 2013). Old basidiomata may last for several months after they have dried up (ELLIS & ELLIS 1990).

In North America *Battarrea phalloides* was found to be associated with *Schinus molle*, as well as *Lycium brevipes*, *Solanum hindsianum*, *Subterminalis salicornia*, *Atriplex*

*linearis*, *Quercus agrifolia* and other oak species, with *Opuntia*, in the coastal dunes with variable soil salinity (ORR & ORR 1979). In Belgium, it was found on samples from sandy soil under bushes of *Sambucus nigra* (DITTMER 1978). In the present study we list for the first time the occurrence of *B. phalloides* in association with *Ziziphus* trees at more than two thousand meters above sea level. In Mexico a basidiomata length of 65 cm (25.6 inches) was recorded (ESQUEDA & al. 2002).

**Distribution:** *Battarrea phalloides* (incl. *B. stevenii*) is rare everywhere but distributed worldwide. It was found in USA (AZ, AK, BC, CA, ID, OR, YT, WA) and western Canada (ARORA 1986, ELLIS & ELLIS 1990, GIBSON 2013, REA 1942, SCHALKWIJK-BARENSEN 1991), South America (Brazil, SOBESTIANSKY 2005), Africa (Angola, Burundi, Kenia, Mauretania, Morocco, Namibia, Socotra, Somalia, South Africa) (JACOBSON & al. 1999, KREISEL 2001, LEVIN & BRANCH 1985, OUTCOUMIT 2007). It is known in the Middle East from Armenia, Azerbaidjan, Georgia, Iran, Israel, and Yemen (KREISEL 2001), in several countries of Europe (Austria, Belgium, Bulgaria, Czech Republic, England, France, Germany, Hungary, Italy, Rumania, Russia, Serbia, Slovakia, Spain) (AUSTRIAN MYCOLOGICAL SOCIETY 2013, DENCHEV & ASSYOV 2010, DITTMER 1978, KREISEL 2001, LANTIERI & al. 2009, LINDTNER 1931-1932, MARTIN & JOHANNESSON 2000, SILLER & al. 2006, WALLEYN & LETEN 2000), in West Pakistan (JEFFRIES & MCLAIN 2004), in China (LIU & FAN 2006), and in Australia (ORCHARD 1996, MAY & al. 2003).

**Taxonomical remarks:** Some authors consider *B. phalloides* and *B. stevenii* as two separate species (GÄUMANN & DODGE 1928, KREISEL 2001, MILLER & MILLER 2006, [www.mycobank.org](http://www.mycobank.org)); others treat them as varieties or forms of only one species (HOLLÓS 1904, REA 1942, [www.indexfungorum.org](http://www.indexfungorum.org)). A recent molecular study (MARTIN & JOHANNESSON 2000) points towards con-specificity of the two taxa.

*Battarrea stevenii* should differ from *B. phalloides* in larger basidiomata, up to 70 centimeters (27.6 inches) (WALLEYN & LETEN 2000), a non-gelatinous inner side of the volva, more yellowish-orange, less ornamented and slightly larger ( $5.6-6.5 \times 5.7-7 \mu\text{m}$  vs.  $4.5-5.25 \times 4.5-5.75 \mu\text{m}$ ) basidiospores (CUNNINGHAM 1932, WATLING & al. 1995).

The similar taxon *Battarreoides diguetii* (PAT. & HAR.) R. HEIM & T. HERRERA, known in the USA and recorded from the Mojave Desert, differs from *Battarrea phalloides* s. l. by smaller basidiomata, smaller endoperidium, and spore release through a number of pores on the upper surface of the endoperidium (ELLIS & ELLIS 1990).
