

	Fe	Pt	Ti	Mt	T	Total
I	1.15	0.28	1.13	0.99	0.66	4.31
II	1.05	0.27	1.00	0.90	0.58	3.80
III	0.90	0.24	0.79	0.74	0.46	3.13
IV	1.07	0.23	1.09	0.98	0.60	3.97

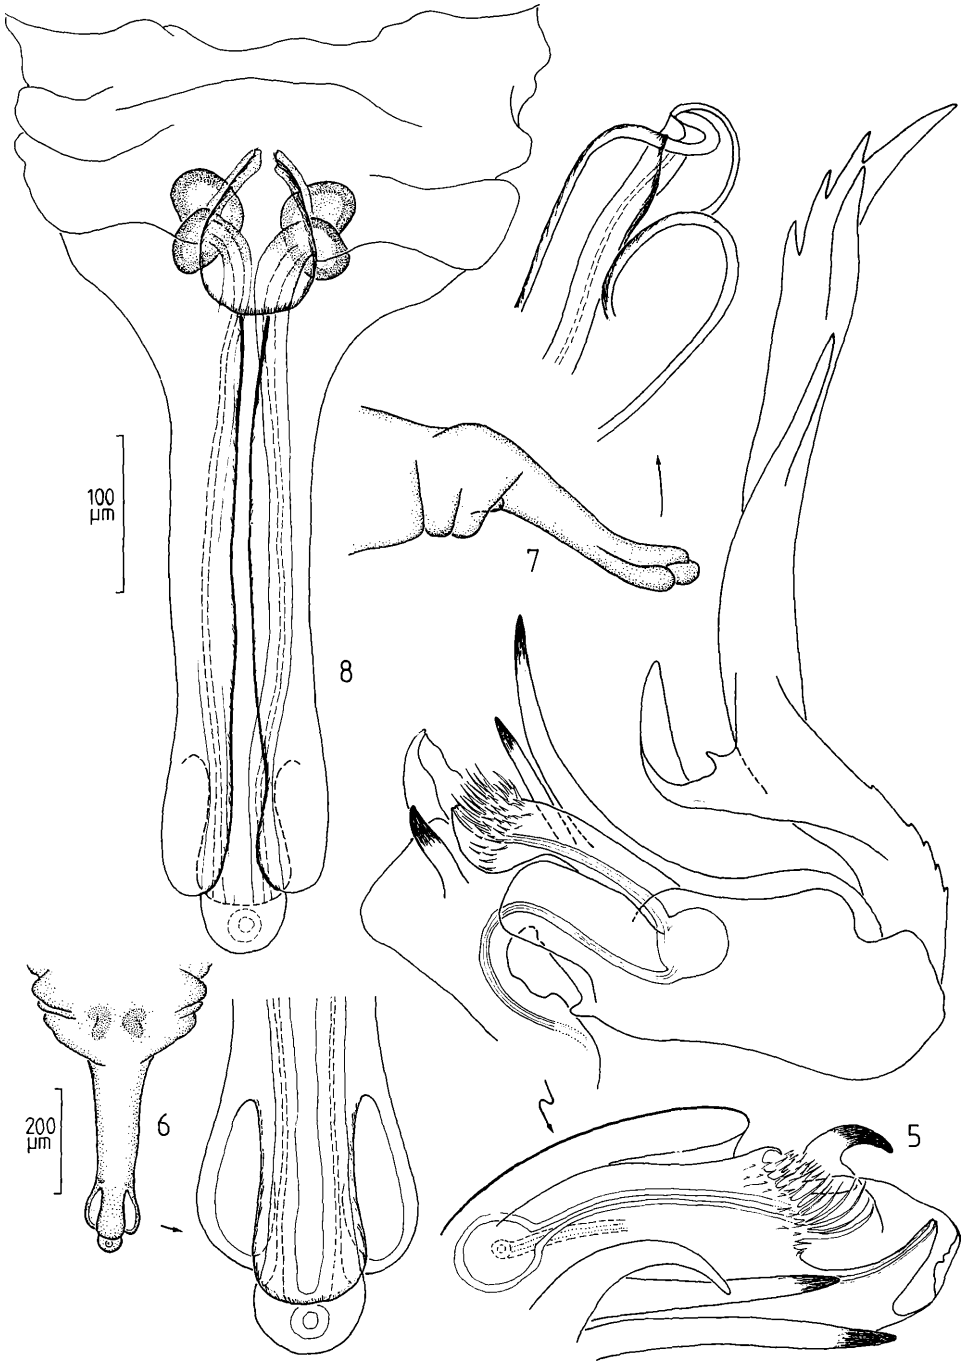

Figs. 1–4: *Lepthyphantes longiseta* SIMON, 1884, ♂. 1: palp, retrolateral; 2: palp, prolateral; 3: palp, ventral; 4: paracymbium.

Genital morphology Convex margin of paracymbium with strong, toothlike apophysis directed against tibia. Lamella narrow and very long, with several slender processes. At its base a well curved projection (Fig. 4). The longer part of the lamella bipartite distally, with some denticulations.

♀: In general habitus and size quite similar to ♂. Leg measurements:

	Fe	Pt	Ti	Mt	T	Total
I	1.05	0.26	1.01	0.90	0.64	3.85
II	1.01	0.26	0.60	0.83	0.56	3.26
III	0.86	0.22	0.70	0.70	0.45	2.93
IV	1.06	0.23	0.96	0.91	0.56	3.72

Tm I 0.16,

Figs. 5–8: *Lepthyphantes longiseta* SIMON, 1884. 5: ♂, distal part of bulb, viewed from different angles; 6: ♀, epigynum, ventral view with detail of distal part of scapus; 7: ♀, epigynum, lateral view with detail of distal part of scapus; 8: ♀, vulva, dorsal.

Genital morphology Scapus of epigynum very long, its margins parallel-sided, widened at base. Distal part of scapus with pair of spoon-like excavations near duct openings.

Remarks *L. longiseta* is a member of the *pallidus* group. It seems to be more closely related with *Lepthyphantes angustiformis* SIMON, 1884 from Corsica and Sardinia. Both species share the very long, distally bipartite lamella of the ♂ palp (SIMON, 1884: 306, figs. 68–69). BRIGNOLI (1985: 55) presumes that *L. longiseta* may be troglophilous.
