New records of mites (Acari: Prostigmata: Erythraeidae, Trombidiidae, Microtrombidiidae, Calyptostomatidae) from Slovenia, with a description of *Campylothrombium nadbori* spec. nov.

Ryszard HAITLINGER¹

UDC (UDK) 595.42:592(497.4)(045)=20

ABSTRACT

Hauptmannia brevicollis, *H. kazimierae*, *H. wratislaviensis*, *H. silesiacus*, *H. pseudolongicollis*, *Erythraeus monikae*, *E. gertrudae*, *Leptus beroni*, *L. echinopus*, *Trombidium holosericeum*, *Podothrombium kordulae*, *P. proti*, *P. tersonderi*, *P. tymoni*, *P. karlovaicus*, *Camerothrombium adamidae* are new to the fauna of Slovenia. *Campylothrombium nadbori* spec. nov. is described. Additional measurements for *E. monikae*, *P. tersonderi* and *C. adamidae* are given.

Key words: Acari, Erythraeidae, Trombidiidae, Microtrombidiidae, Calyptostomatidae, new species, faunistics, Slovenia

IZVLEČEK

Nove najdbe pršic (Acari: Prostigmata: Erythraeidae, Trombidiidae, Microtrombidiidae, Calyptostomatidae) v Sloveniji, z opisom *Campylothrombium nadbori* spec. nov. - Za favno Slovenije so nove naslednje vrste: *Hauptmannia brevicollis*, *H. kazimierae*, *H. wratislaviensis*, *H. silesiacus*, *H. pseudolongicollis*, *Erythraeus monikae*, *E. gertrudae*, *Leptus beroni*, *L. echinopus*, *Trombidium holosericeum*, *Podothrombium kordulae*, *P. proti*, *P. tersonderi*, *P. tymoni*, *P. karlovaicus* in *Camerothrombium adamidae*. Opisana je *Campylothrombium nadbori* spec. nov. Podane so dodatne meritve za vrste *E. monikae*, *P. tersonderi* in *C. adamidae*.

Ključne besede: pršice, Erythraeidae, Trombidiidae, Microtrombidiidae, Calyptostomatidae, nove vrste, favna, Slovenija

¹ Kozuchowska 5b, 51-631 Wrocław, Polska

Introduction

In Slovenia, mites belonging to the families Erythraeidae, Trombidiidae, Microtrombidiidae and Calyptostomatidae are unknown besides *Leptus mariae* HAITLINGER, *Erythraeus styriacus* TURK, 1981 and *Calyptostoma velutinus* (O. F. MÜLLER) (TURK, 1981, SOUTHCOTT, 1992). In this paper, 16 species new to the fauna of Slovenia are listed and *Campylothrombium nadbori* spec. nov. is described. Most of the species were recorded for the first time above the altitude of 1200 m.

From 22 to 26 June, 2002, 112 larvae belonging to 19 species were collected. All measurements are given in ēm. The terminology of structure and setal notation for erythraeids, trombidiids and microtrombidiids are adapted from SOUTHCOTT (1992, 1994) and HAITLINGER (1998). Holotype and paratype of *Campylothrombium nadbori* are deposited in the Museum of Natural History, Wrocław University (MNHWU).

Results

Family Erythraeidae ROBINEAU-DESVOIDY, 1828

Hauptmannia brevicollis OUDEMANS, 1910

Material: Trstenik n. Kranj, 27 June, 2002, 5 larvae; Lovrenc n. Maribor, 23 June, 2002, 1 l; Rogla, 1400 m asl, 23 June, 2002, 7 l (1 larva from undetermined Thysanoptera); Padeški vrh n. Rogla, 23 June, 2002.

Distribution: Species widely distributed in Europe (HAITLINGER 2002). Localities from Slovenia are the southernmost in Europe. In Europe, Rogla and Padeški vrh are the highest localities for *H. brevicollis*. First record from Slovenia.

Hauptmannia kazimiera HAITLINGER, 1986

Material: Rogla, 1400 m asl, 23 June, 2002, 32 l; Log n. Bohinjska Bistrica, 26 June, 2002, 3 l; Padeški Vrh n. Rogla, 23 June 2002, 3 l.

Distribution: Poland, Slovakia, Slovenia. To date, this species was known from few localities in Europe; mainly from wet meadows was recorded (HAITLINGER 1986, 1987, 2002). Rogla and Padeški vrh are the highest localities for *H. kazimiera* in Europe. First record from Slovenia.

Hauptmannia wratislaviensis HAITLINGER, 1986

Material: Rogla, 1400 m asl, 23 June 2002, 7 l; Padeški vrh n. Rogla, 23 June, 2002, 1 l; Ljutomer, 22 June, 2002, 1 l.

Distribution: Iceland, Scotland, Norway, Russia, Lithuania, Poland, Switzerland, Slovenia. Up to date, this species has been known only from Northern and Central Europe (HAITLINGER 1986, 1994a, 1998, 2000, SOUTHCOTT 1989). First record from Slovenia.

Hauptmannia silesiacus HAITLINGER, 1986**Material:** Križ n. Sežana, 28 June, 2002, 11.**Distribution:** Poland, Slovakia, Slovenia. To date, this rare species has been known from four sites in Poland and one locality in Slovakia (HAITLINGER 1986, 1987c, 2000, 2002). First record from Slovenia.***Hauptmannia pseudolongicollis*** HAITLINGER, 1987**Material:** Trstenik n. Kranj, 27 June, 2002, 11.**Distribution:** Poland, Italy, Slovenia. Rare species, known only from single localities in three countries (HAITLINGER 1987a, 1996). First record from Slovenia.***Erythraeus monikae*** HAITLINGER, 1987**Material:** Trstenik n. Kranj, 27 June, 2002, 11.**Distribution:** Finland, Germany, Poland, Slovakia, Slovenia. Rare species. Hitherto, only eight specimens have been recorded (HAITLINGER 1987b, 1995, 2000a, 2002). As its measurements have been published only for Polish holotype and paratype, dimensions for other specimens (from Slovenia, Finland and Slovakia), now in Table 1, are given. First record from Slovenia.

***Erythraeus gertrudae* HAITLINGER, 1987**

Material: Rogla, 1400 m asl, 23 June, 2002, 6 l (one specimen from undetermined larva of Homoptera); Padeški vrh n. Rogla, 23 June, 2002, 1 l.

Distribution: Norway, Poland, Slovakia, Slovenia. To date, this species has been registered only in lowland areas (HAITLINGER 1987b, 2000, 2002). Rogla and Padeški vrh are the highest-lying localities for *E. gertrudae* in Europe. First record from Slovenia.

***Leptus beroni* FAIN, 1992**

Material: Rogla, 1400 m asl, 23 June, 2002, 5 l.

Distribution: Belgium, Bulgaria, Germany, Poland.

The highest-lying locality for *L. beroni* in Europe First record from Slovenia.

***Leptus echinopus* BERON, 1975**

Material: Ljubljana, 25 June, 2002, 1 l; Padeški vrh n. Rogla, 23 June, 2002, 1 l.

Distribution: Species common in Europe. Padeški vrh is the highest-lying locality for *L. echinopus* in Europe. First record from Slovenia.

Family Trombidiidae LEACH, 1815

***Podothrombium kordulae* HAITLINGER, 1995**

Material: Trstenik n. Kranj, 27 June, 2002, 1 l; vicinity of Vršič, 1517 m asl, Alps, 23 June, 2002, 6 l.

Distribution: Germany, Poland, Russia (Sankt Petersburg), Slovakia, Slovenia. A rarely recorded species (HAITLINGER 1995c, 2000, MAKOL 1998). In Europe, the vicinity of Vršič is the highest-lying locality for *P. kordulae*. First record from Slovenia.

***Podothrombium proti* HAITLINGER, 1994**

Material: Vicinity of Vršič, 1517 m asl, 23 June 2002, 6 l.

Distribution: Italy, Poland, Slovenia, Turkey.

Rare species, probably closely associated with mountainous and piedmont places (HAITLINGER 1994b, 1995b, 1999). In Europe, vicinity of Vršič is the highest-lying locality for *P. proti*. First record from Slovenia.

***Podothrombium tersonderi* HAITLINGER, 1995**

Material: Rogla, 1400 m asl, 23 June 2002, 1 l.

Distribution: Poland, Slovakia, Slovenia. This species has been known only for its two specimens from Poland and Slovakia (HAITLINGER 1995c, 2002). Therefore, standard measurements for the third specimen from Slovenia are given in Table 2. Rogla is the highest-lying locality for *P. tersonderi* in Europe. First record from Slovenia.

Podothrombium tymoni HAITLINGER, 1994

Material: Log n. Bohinjska Bistrica, 26 June, 2002, 1 l; vicinity of Vršič, 1517 m asl, 23 June, 2002, 5 l.

Distribution: Austria, Poland, Slovenia.

Rarely recorded species, probably associated only with mountainous and piedmont places and meadows in forests or their immediate vicinity (HAITLINGER 1994, 1995b). Vicinity of Vršič is the highest-lying locality for *P. tymoni* in Europe. First record from Slovenia.

Podothrombium karlovaicus HAITLINGER, 2003

Material: Vicinity of Vršič, 1517 m asl, 23 June, 2002, 3 l.

Distribution: Czech Republic, Slovenia.

Rarely recorded species, probably associated only with mountainous places (HAITLINGER, 2003).

Allothrombium fuliginosum (HERMANN, 1804)

Material: Celje, 24 June, 2002, 1 l; Log n. Bohinjska Bistrica, 26 June, 2002, 2 l; Bled, 26 June, 2002, 2 l; Ormož, 22 June, 2002, 1 l.

Distribution: common species throughout Europe.

***Trombidium holosericeum* (LINNAEUS, 1758)**

Material: Celje, 24 June, 2002, 1 l; Ljutomer, 22 June, 2002, 1 l; vicinity of Vršič, 1517 m asl, 23 June, 2002, 1 l.

Distribution: common species throughout Europe. First record from Slovenia.

Lamily **M i c r o t r o m b i d i i d a e** THOR, 1935

***Camerotrombium adamidae* HAITLINGER, 1998**

Material: Trstenik n. Kranj, 27 June, 2002, 1 l; Ljutomer, 22 June, 2002, 1 l; Ormož, 22 June 2002, 1 l.

Distribution: Poland, Slovenia.

This species has been known only for its single specimen from Poland; measurements given for this species have been incomplete (HAITLINGER 1998). Therefore, standard measurements for the second specimen from Slovenia are given in Table 3. First record from Slovenia.

Table 3. Metrie data for *Camerotrombium adamidae* HAITLINGER; P – Poland, S – Slovenia.

Campylothrombium nadbori spec. nov.

Diagnosis. Anterior scutum partly covered by longitudinal striae, posterior scutum without striae. Hypostomalae broad with about 7 blunted digitations. Pygidial setae 110 µm long. Claws I-III trifurcate. TaI 90-100 µm long.

Type. Holotype larva from Slovenia, vicinity of Vršič, 1517 m asl, 23 June, 2002; paratype 11, the same data as for holotype. Leg. R. Haitlinger; deposited in MNHWU.

Description

Dorsum with 20 barbed setae not placed on platelets. Each lateral pair of eyes on ocular shield, 36 µm long; anterior cornea the larger, 8 µm across, posterior cornea 6 µm across. Anterior dorsal scutum with laterally placed delicate longitudinal striae. Posterior border of scutum slightly convex, its posterolateral borders distinctly concave. Scutalae PL longer than AL, slightly barbed. AL, AM and S all are nude (Fig. 3).

Posterior dorsal scutum with almost straight anterior border and rounded posterior border. It bears two slightly barbed setae 60 µm long.

Ventral surface of idiosoma with 8 setae, all setulose; the longest posterior pair 110 µm long. Between coxae III a pair of very short and weakly barbed seta. Coxae I with medials setae bearing 3 setules; basal setae are nude. Seta on coxa II and coxa III, both with small setules (Fig. 2). Gnathosoma with short hypostomalae with digitations and two nude galealae. Palpal formula: 0-0-0-2N-6N. Palptarsus has two relatively long setae (Fig. 4).

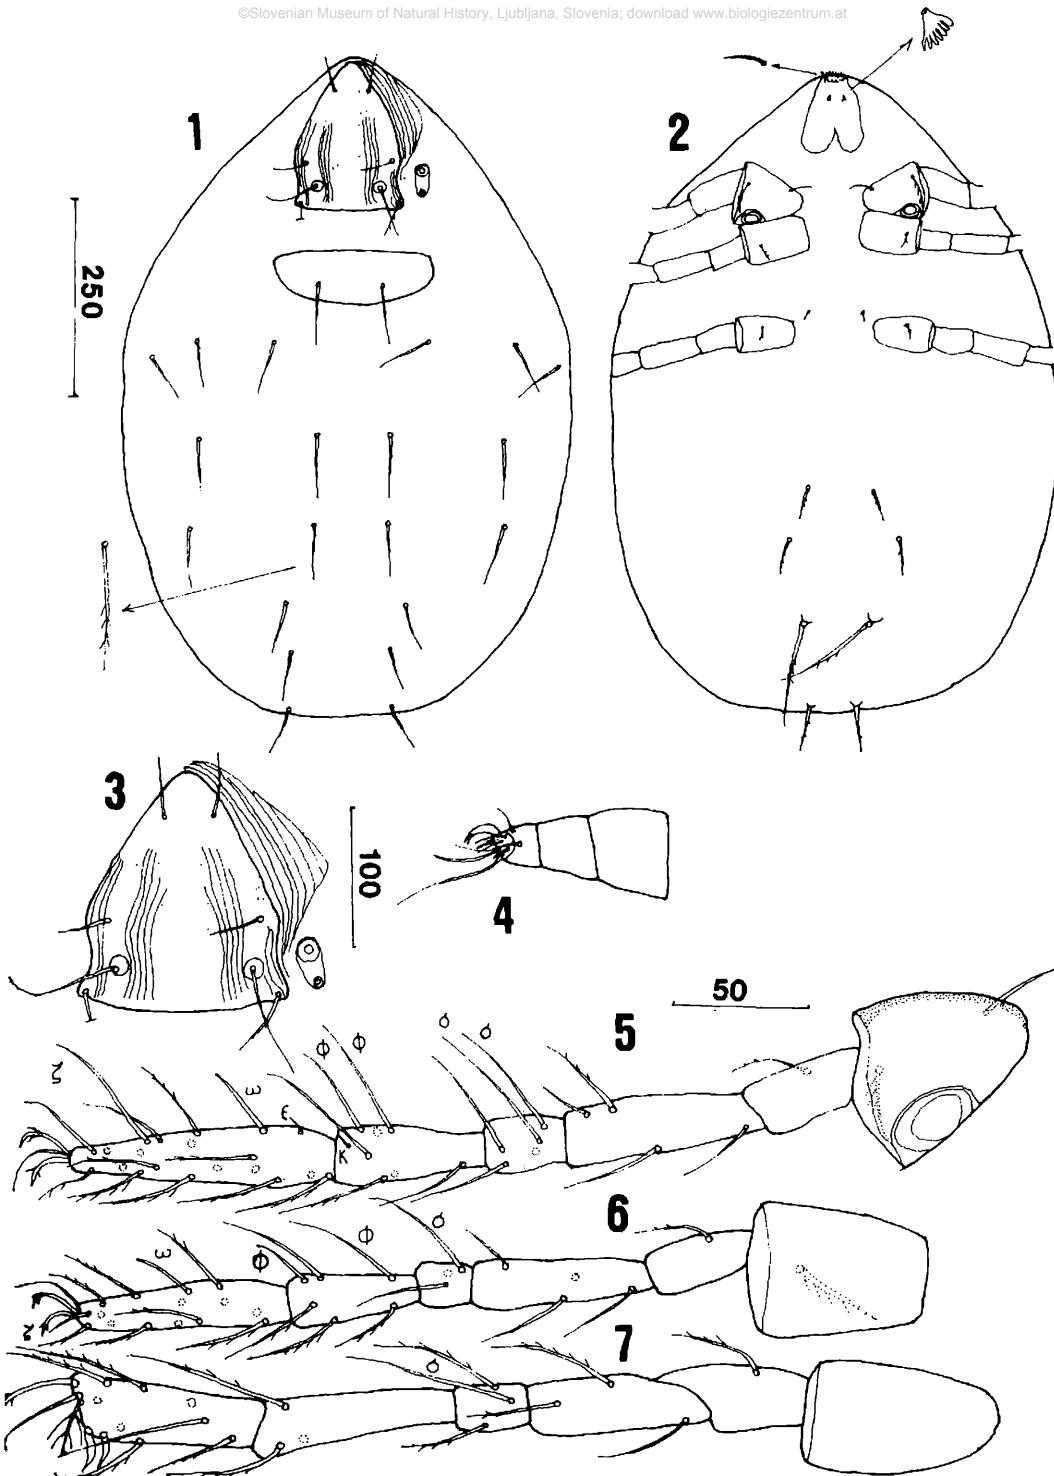

Leg lengths (including coxae, excluding claws):

Leg I. The setal formula: Ta 1ω, 1ε, 1ζ, 18B; Ti 2φ, 1κ, 1B, 5N; Ge 2σ, 4N; Fe 1B, 4N, Tr 1B. Solenidia φ and σ are relatively very long (Fig. 5).

Figures

Campylothrombium nadbori spec. nov.

Figs. 1-7

1. Idiosoma, dorsal view, 2. Idiosoma, ventral view, 3. Scutum, 4. Palp, 5. Leg I, tarsus-coxa, 6. Leg II, tarsus-coxa, 7. Leg III, tarsus-coxa

Leg II. Ta 1 ω , 1 ζ , 13B; Ti 2 φ , 1N, 3B; Ge 1 σ , 2N, Fe 5N; Tr 1B. Solenidia on Ti and Ge are relatively long (Fig. 6).

Leg III. Ta 10B, 1N; Ti 5B; Ge 1 σ , 2B; Fe 2B, 2N; Tr 1B. Solenidion δ is relatively long (Fig. 7). Measurements are given in Table 4.

Etymology. The name of the species derived from the name Nadbor.

Remarks

Using key by SOUTHCOTT's (1994) for Microtrombidiidae is difficult to establish generic status of *C. nadborensis*. It has features typical of the genus *Campylothrombium*, such as: setae behind posterior dorsal scutum not on platelets, formula coxalae BN, B, B, anterior and posterior claws of tarsi I and II, and posterior claw of tarsus III, trifid with small terminal spurs and hypostomalae short with several blunted digitations. The following untypical features were also noted: not striate posterior scutum and longitudinal striations of anterior dorsal scutum not occupying its whole area. These features were also noted in *C. schwangauensis* HAITLINGER, provisionally included in this genus (HAITLINGER 1995).

SOUTHCOTT (1994) included in this genus *Campylothrombium barbarum* (LUCAS) (sensu ROBAUX, 1974) and *C. striaticeps* (OUDEMANS). Later, further three species, i.e. *C. schwangauensis* HAITLINGER, *C. lamberti* HAITLINGER and *C. tomiri* HAITLINGER were described (HAITLINGER 1995, 1998). *C. nadborensis* nov. sp. differs from *C. schwangauensis* in 20 dorsal setae vs 16 in *C. schwangauensis*, more longitudinal striae on scutum and setae placed behind posterior scutum each without platelet; *C. schwangauensis* has four setae with platelets; shorter AW (104-110 vs 134), PW (144-146 vs 162) and TiIII (64-66 vs 74-80). From *C. barbarus* it differs in the number of dorsal setae (20 vs 26), not striate posterior scutum, shorter AW (104-110 vs 120-129), longer AL (32-40 vs 27-30), PL (52-54 vs 47-51) and MA (78-84 vs 71-77), from *C. lamberti* in not striate posterior scutum, shorter AW (104-110 vs 134), PW (144-146 vs 160), ASB (138-140 vs 170), longer SP (32 vs 22) and AP (52-54 vs 44); from *C. tomiri* by not striate posterior scutum, shorter AW 104-110 vs 132), PW (144-146 vs 166), MA (78-84 vs 92), ASB (138-140 vs 164) and from *C. striaticeps* in not striate posterior scutum.

Lamily **C a l y p t o s t o m a t i d a e** OUDEMANS, 1923

***Calyptostoma velutinus* (O. F. MÜLLER, 1776)**

Material: Trstenik n. Kranj, 27 June, 2002, 11.

Distribution: Species widely distributed in Europe.
