

Four new species of the genus *Sclerum* Dejean (Coleoptera: Tenebrionidae: Opatrini) from South East Asia

ROLAND GRIMM

Abstract

The following new species of the genus *Sclerum* Dejean, 1834 are described: *S. impressicolle* n. sp., *S. impressifrons* n. sp., *S. laoticum* n. sp., and *S. sinuatocolle* n. sp. New synonym: *Sclerum elongatulum* (Chatanay, 1917) n. syn. = *S. ferrugineum* (Fabricius, 1801). Lectotypes are designated for *Opatrum ferrugineum* Fabricius, 1801, *Scleron denticolle* Fairmaire, 1882, *Scleron discicolle* Reitter, 1904, and *Scleron elongatulum* Chatanay, 1917. New faunistic data of *Sclerum ferrugineum* (Fabricius, 1801) are given.

Key words: Tenebrionidae, Opatrini, *Sclerum*, Asia, new species, lectotype designation, new synonym, new records.

Zusammenfassung

Folgende neue Arten der Gattung *Sclerum* Dejean, 1834 werden beschrieben: *S. impressicolle* n. sp., *S. impressifrons* n. sp., *S. laoticum* n. sp. und *Sclerum sinuatocolle* n. sp. Neues Synonym: *Sclerum elongatulum* (Chatanay, 1917) n. syn. = *S. ferrugineum* (Fabricius, 1801). Lectotypen werden für *Opatrum ferrugineum* Fabricius, 1801, *Scleron denticolle* Fairmaire, 1882, *Scleron discicolle* Reitter, 1904 und *Scleron elongatulum* Chatanay, 1917 designiert. Neunachweise für *Sclerum ferrugineum* (Fabricius, 1801) werden gegeben.

1 Introduction

The Oriental species of the genus *Sclerum* Dejean, 1834 (Tenebrioninae Latreille, 1802, Opatrini Brullé, 1832) were treated by KASZAB (1942) under the preoccupied name *Scleron* Hope, 1840. Newly collected material in Southeast Asia included different species related to *S. elongatulum* in the sense of KASZAB (1942: fig. 2). The comparison with type specimens revealed that KASZAB (1942) misinterpreted *S. elongatulum* (Chatanay, 1917). In the present paper four new species of *Sclerum* are described, a new synonym is proposed, and new faunistic data of *Sclerum ferrugineum* (Fabricius, 1801) are given. Photographs of the discussed species including their aedeagi are added and an identification key is provided.

Acknowledgements

For loan of specimens I thank Drs. MICHAEL BALKE (Munich), HANS J. BREMER (Osnabrück), RON FELIX and PASQUALE CILIBERTI (Leiden), MARTIN LILLIG (Saarbrücken), ANTOINE MANTILLERI (Paris), OTTÓ MERKL (Budapest), WOLFGANG SCHAWALLER (Stuttgart), HARALD SCHILLHAMMER (Wien), ALEXEY SOLODOVNIKOV and SREE G. SELVANTHARAN (Copenhagen), and EVA SPRECHER and ISABELLE ZÜRCHER (Basel). I am grateful to Dr. MICHAEL BALKE

(München) for assistance in loaning type specimens of *Sclerum elongatulum* (Chatanay) from MNHN and JOHANNES REIBNITZ (Stuttgart) for producing the photographs and arranging them on plates. Dr. OTTÓ MERKL (Budapest) and Dr. WOLFGANG SCHAWALLER (Stuttgart) reviewed the manuscript.

2 The species

Sclerum ferrugineum (Fabricius, 1801) (Figs. 4, 6)

Opatrum ferrugineum Fabricius, 1801 (FABRICIUS 1801: 118)

Opatrum tuberculatum Besser, 1832 (BESSER 1832: 18); GEBIEN (1938: 419, syn.)

Scleron denticolle Fairmaire, 1882 (FAIRMAIRE 1882: 219); GEBIEN (1906: 217, syn.)

Scleron discicolle Reitter, 1904 (REITTER 1904: 125); GEBIEN (1906: 217, syn.)

Scleron elongatulum Chatanay, 1917 (CHATANAY 1917: 235), **n. syn.**

Type material studied

The type series of *Opatrum ferrugineum* Fabricius, 1801 consists of three specimens with the following labels: First specimen: 19. *ferrugineum* [handwritten on white paper with black frames], *Opatrum ferrugineum* [handwritten by FABRICIUS on white paper], designated herewith as lectotype (ZMUC, formerly Kiel collection). – Second specimen (paralectotype): Java., Mus: T: Lund, *Opatrum ferrugineum* F. [handwritten on white paper with black frames], Type [printed on red label], green square label without text, ZMUC 00508640 [printed on white label]. – Third specimen (paralectotype): Type [printed on red label], green square label without text, ZMUC 00508641 [printed on white label].

Two syntypes of *Scleron denticolle* Fairmaire, 1882 have the following labels: First specimen: type [handwritten on white label], *Scleron denticolle* “n. sp.? [illegible]” [handwritten on white label by FAIRMAIRE], Sum. Exp., Rawas, 5/78 [handwritten on round, white label], Ravas, 5.78 [handwritten on white, square label with black frames], red square label without text; designated herewith as lectotype (NBCN). – Second specimen (paralectotype): type [handwritten on white label], J.C. VAN HASSELT, Boenga Maes, Palembang. [handwritten on round, white label], red square label without text (NBCN).

Five syntypes of *Scleron discicolle* Reitter, 1904 have the following labels: First specimen: Fieber, Mulmein, 1871. [handwritten on white label], *Scleron discicollis* [sic!] m. 1903 [handwritten on white label by REITTER], designated herewith as lectotype (NHMW). – Second specimen (paralectotype): Fieber, Mulmein, 1871. [handwritten on white label], *Scleron discicollis* [sic!] m. 1903 [handwritten on white label by REITTER] (NHMW). – Third specimen (paralectotype): Knb, b [handwritten on white label], *Scleron discicollis* [sic!] m. 1903 [handwritten on white label by REITTER] (NHMW). – Fourth specimen (paralectotype): *Scleron discicollis* [sic!] m. 1903 [handwritten on white label by REITTER] (NHMW). – Fifth specimen (paralectotype): *Tuberculatum*, Ind. Or., Ziegl. [handwritten on white label] (NHMW).

Two syntypes of *Scleron elongatulum* Chatanay, 1917 have the following labels: First specimen: Rangoon [handwritten on white mounting card], Type [printed on red label], Museum Paris, Coll. J. CHATANAY 1914 [printed on white label with black frame], *Scleron elongatulum* n. sp. [handwritten on white mounting card], designated herewith as lectotype (MNHN). – Second specimen (paralectotype): Rangoon [handwritten on white mounting card], Paratype [printed on red label], Museum Paris, Coll. J. CHATANAY 1914 [printed on white label with black frame], *Scleron elongatulum* n. sp. [handwritten on white mounting card] (MNHN).

Synonymy

CHATANAY (1917) separated *Sclerum elongatum* (Chatanay, 1917) from *Sclerum ferrugineum* (Fabricius, 1801) mainly by the small body size. The body size of *Sclerum ferrugineum* (Fabricius, 1801) is highly variable: body length 5.2–7.1 mm, body width 2.3–3.1 mm. The study of type-specimens of *S. elongatum* revealed that these are smaller (body length 5.7–6.0 mm, body width 2.3–2.6 mm) specimens of FABRICIUS' (1801) *S. ferrugineum*, so *S. elongatum* is considered as a junior synonym of *S. ferrugineum*.

Distribution

India; Indonesia: Java, Sumatra, Sumbawa; Myanmar; Nepal; Philippines: Mindoro, Luzon; “S. China”; Taiwan; Vietnam (CHATANAY 1917, FABRICIUS 1801, FAIRMAIRE 1882, 1893, KASZAB 1942, LÖBL & SMETANA 2008, REITTER 1904, SCHAWALLER 2012). E Malaysia; Indonesia: Bali, Kisar, Sulawesi, Selayar; Oman; Thailand (new records).

Etymology

Impressus (Lat.) = impressed combined with *collum* (Lat.) = neck (refers in this case to the pronotum).

Description

Oblong, subparallel-sided, ferruginous, whole surface rather densely micro-granulate, matt to faintly shining. Body length 4.8–5.5 mm, body width 2.1–2.5 mm.

Head widest at middle of rounded genae and here somewhat wider than at eye level; anterior border of clypeus arcuate from gently notched clypeo-genal meeting to V-shaped emargination in the middle; between clypeus and frons with transversal elevation, behind this broadly, transversely furrowed; at the inner border of eyes with high elevation; in the middle between the eye elevations with elevation composed of high tubercles. Surface predominantly granulate, except of transversal furrow. Each granule bearing scale-like seta.

Pronotum transverse, with disc transversely convex; sides broadly explanate in about apical three-fifths; widest behind middle, thence at first subparallel then arcuate towards anterior angles, deeply emarginate towards posterior angles, so that the explanation is narrow basally. Lateral border of strongly explanate part basally blunt. Base wider than apex, slightly notched in the middle, nearly straight towards, but emarginate before posterior angles. Apex in the middle with transverse bulge. Anterior angles subrectangular, protruding beyond apical border. Posterior angles acute, tooth-like. Convex disc latero-basally with deep, round impression. Surface covered with setigerous granules as on head.

Elytra elongate, subparallel-sided for about two-thirds of their length, then broadly arcuate towards apices. Intervals predominantly with one row of small setigerous granules, only basally thickened parts of elevated intervals partly with two rows. 3rd, 5th, and 7th intervals elevated and somewhat thickened at base; intermediate intervals less prominent. Seriate setigerous punctures large and deep; between 7th interval and lateral border with 3 rows of punctures.

Legs: Tarsi laterally compressed.

Aedeagus see Fig. 7.

Differential diagnosis

Sclerum impressicolle n. sp., *S. impressifrons* n. sp., and *S. sinuatocolle* are similar in body size and shape. In *S. impressifrons* n. sp. and *S. sinuatocolle* n. sp., how-

Figs. 1–5. *Sclerum* spp., dorsal view. – 1. *S. sinuatocolle* n. sp., ♂ holotype (NHMB). 2. *S. impressifrons* n. sp., ♂ holotype (CRG). 3. *S. impressicolle* n. sp., ♂ holotype (CRG). 4. *S. ferrugineum* (Fabricius), non-type (CRG). 5. *S. laoticum* n. sp., ♂ holotype (SMNS).

Figs. 6–10. *Sclerum* spp., aedeagi, dorsal (left) and lateral (right) views. – 6. *S. ferrugineum* (Fabricius), non-type (CRG). 7. *S. impressicolle* n. sp., paratype (CRG). 8. *S. impressifrons* n. sp., holotype (CRG). 9. *S. laoticum* n. sp., holotype (SMNS). 10. *S. sinuatoColle* n. sp., holotype (NHMB).

ever, the posterior corner of the broadly explanate part of the pronotum is not blunt, but is forming an angulation (*S. impressifrons* n. sp.) or is tooth-like (*S. sinuatoColle* n. sp.). The three species can also be recognized by the distinctly different shape of the aedeagus (compare Figs. 7, 8, 10).

***Sclerum impressifrons* n. sp.**

(Figs. 2, 8)

Holotype ♂: Thailand, Mae Hong Son Prov., Soppong (Pangmapa), 4.V.2004, R. GRIMM leg. (CRG).

Paratypes: Same data as holotype, 3 ex. (CRG). – Thailand, Mae Hong Son, 26.–27.IV. 2003, R. GRIMM leg., 1 ♂ (SMNS).

Etymology

Impressus (Lat.) = impressed combined with frons (Lat.) = forehead, front.

Description

Oblong, subparallel-sided, ferruginous, whole surface rather densely micro-granulate, matt to faintly shining. Body length 4.5–4.7 mm, body width 1.9–2.1 mm.

Head widest at basal part of genae and here wider than at eye level; anterior border of clypeus arcuate from gently notched clypeo-genal meeting to U-shaped emargination in the middle; between clypeus and frons with transversal elevation, behind this broadly, transversely furrowed; at the inner border of eyes with high elevation; in the middle between the eye elevations with elevation composed of high tubercles. Surface predominantly granulate, except of transversal furrow. Each granule bearing scale-like seta.

Pronotum transverse, with disc transversely convex; sides broadly explanate in about apical three-fifths; widest behind middle, thence at first shallowly emarginate then arcuate towards anterior angles, deeply emarginate towards posterior angles, so that the explanation is narrow basally. Lateral border of strongly explanate part basally forming a blunt tooth. Base about as wide as apex, bisinuate. Apex in the middle with transverse elevation. Anterior angles acute, protruding beyond apical border. Posterior angles acute, tooth-like. Convex disc latero-basally with impression. Surface covered with setigerous granules as on head.

Elytra elongate, subparallel-sided for about two-thirds of their length, then broadly arcuate towards apices. Intervals predominantly with one row of small setigerous granules, only 2nd interval on basally thickened part and on apical declivity partly with two irregular rows. Intervals nearly equal, only 2nd interval slightly more elevated, especially basally. Seriate setigerous punctures large and deep; between 7th interval and lateral border with 3 rows of punctures.

Legs: Tarsi laterally compressed.

Aedeagus see Fig. 8.

Differential diagnosis

Sclerum impressifrons n. sp. shares with *S. sinuatoColle* n. sp. the distinct posterior corner basally of the broadly explanate part of the pronotum which is tooth-like in *S. sinuatoColle* n. sp., but only angulate in *S. impressifrons* n. sp. In *S. sinuatoColle* n. sp. the body is wider on average (body width 2.1–2.7 mm) than in *S. impressifrons* n. sp. (body width 1.9–2.1 mm). Both species differ distinctly in the shape of the aedeagus (Figs. 8, 10).

Sclerum sinuatocolle n. sp.

(Figs. 1, 10)

Holotype ♂: Thailand, Umphang, 500 m, 16°04'N 98°53'E, 26.IV.–6.V.1991, D. KRÁL leg. (NHMB).

Paratypes: Same data as holotype, 5 ex. (NHMB), 1 ex. (CRG). – Thailand, Lansang Nat. Park, 500 m, 16°48'N 98°57'E, 18.–24.IV.1991, D. KRÁL leg., 3 ex. (NHMB). – Nepal, Sauraha, Chitwan Nat. (SMNS). – Myanmar (labelled as Birma), Inya Lake, 30.VIII.1978, X. BELLÉS leg., 3 ex. (HNHM). – [India], I. Andaman, 1877, DEYROLLE leg., 2 ex. (HNHM).

Etymology

Sinuatus (Lat.) = sinuate, combined with collum (Lat.) = neck (refers in this case to the pronotum).

Description

Oblong, subparallel-sided, ferruginous to piceous, whole surface rather densely micro-granulate, matt to faintly shining. Body length 4.9–5.8 mm, body width 2.1–2.7 mm.

Head widest at basal part of genae and here slightly wider than at eye level; anterior border of clypeus arcuate from clypeo-genal meeting to V-shaped emargination in the middle; between clypeus and frons with transversal elevation, behind this broadly, transversely furrowed; at inner border of eyes with high elevation; in the middle between the eye elevations with elevation composed of high tubercles. Surface predominantly granulate, except of transversal furrow. Each granule bearing scale-like seta.

Pronotum transverse, with disc transversely convex; sides broadly explanate in about apical three-fifths; widest behind middle, thence at first shallowly emarginate then arcuate towards anterior angles, deeply emarginate towards posterior angles, so that the explanation is narrow basally. Lateral border of strongly explanate part basally tooth-like or at least angulate. Base somewhat wider than apex, bisinuate. Apex in the middle with transverse bulge. Anterior angles subrectangular, protruding beyond apical border. Posterior angles acute, tooth-like. Convex disc latero-basally with impression. Surface covered with setigerous granules as on head.

Elytra elongate, subparallel-sided for about two-thirds of their length, then broadly arcuate towards apices. Intervals predominantly with one row of small setigerous granules, only basally thickened parts of elevated intervals partly with two rows. 3rd, 5th, and 7th intervals elevated and slightly thickened at base; intermediate intervals less

prominent. Seriate setigerous punctures large and deep; between 7th interval and lateral border with 3 rows of punctures.

Legs: Tarsi laterally compressed.

Aedeagus see Fig. 10.

Differential diagnosis

See under *Sclerum impressifrons* n. sp.

Sclerum laoticum n. sp.

(Figs. 5, 9)

Holotype ♂: Laos, S Udomxai Prov., Pak Beng, 450 m, 19°53'37"N 101°07'50"E, 18.–27.V.2001, J. KOLIBÁČ leg. (SMNS).

Paratypes: Same data as holotype, 1 ♀ (SMNS), 1 ♂ (CRG). – Laos, Lao Muang env., V.2004, O. ŠAFRÁNEK leg., 2 ♂♂ (SMNS).

Etymology

The species name refers to Laos where the type series was collected.

Description

Oblong, subparallel-sided, blackish brown to black, whole surface rather densely micro-granulate, faintly shining. Body length 7.2–8.0 mm, body width 3.0–3.4 mm.

Head widest between genae and here only slightly wider than at eye level; anterior border of clypeus arcuate from gently notched clypeo-genal meeting to V-shaped emargination in the middle; between clypeus and frons with transversal elevation, behind this broadly, transversely furrowed; at inner border of eyes with high elevation. Clypeus, transversal elevation, apical slope of genae, elevations at inner border of eyes, frons in the middle and latero-apically granulate. Each granule bearing scale-like seta.

Pronotum transverse, with disc transversely convex; sides explanate in about apical three-quarters; widest behind middle, thence at first subparallel then arcuate towards anterior angles, abruptly and deeply emarginate towards posterior angles. Lateral border of explanate part basally rounded. Base as wide as apex, shallowly bisinuate, in the middle protruding posteriorly and arcuate, only slightly emarginate before posterior angles. Apex feebly bisinuate, in the middle with transverse bulge. Anterior angles acute, protruding beyond apical border. Posterior angles acute, toothlike. Surface covered with setigerous granules as on head.

Elytra elongate, subparallel-sided for somewhat more than half of their length, then broadly arcuate towards apices; with rows of setigerous punctures, and slightly convex intervals with single rows of small setigerous granules. Punctural rows somewhat broader than intervals. 3rd, 5th, and 7th intervals only slightly more raised than remaining

intervals; between 7th interval and lateral border with 3 rows of punctures.

Legs: Tarsi cylindrical.

Aedeagus see Fig. 9.

Differential diagnosis

In *Sclerum laoticum* n. sp. the lateral border of the pronotum behind the middle is deeply emarginate as in *S. impressicolle* n. sp., *S. impressifrons* n. sp., and *S. sinuato-colle* n. sp., but it is distinguished by the larger body size, the cylindrical tarsi which are not depressed laterally, and the shape of the aedeagus (Fig. 9).

3 Key to species of *Sclerum* described and discussed in this paper

- 1 Lateral border of pronotum behind the middle only weakly emarginate; body shape see Fig. 4, aedeagus see Fig. 6. *ferrugineum*
- Lateral border of pronotum behind the middle strongly emarginate. **2**
- 2 Larger, body length over 7 mm; tarsi cylindrical; body shape see Fig. 5, aedeagus see Fig. 9. *laoticum* n. sp.
- Smaller species, body length under 6 mm; tarsi laterally compressed. **3**
- 3 Outer corner of pronotum at base of broadly explanate part blunt, body shape see Fig. 3, aedeagus see Fig. 7. *impressicolle* n. sp.
- Outer corner of pronotum at base of broadly explanate part at least somewhat angulate or tooth-like. **4**
- 4 Outer corner of pronotum at base of broadly explanate part tooth-like; body wider on average (body width 2.1–2.7 mm); body shape see Fig. 1, aedeagus see Fig. 10. *sinuato-colle* n. sp.
- Outer corner of pronotum at base of broadly explanate part forming an angulation; body narrower on average (body width 1.9–2.1 mm); body shape see Fig. 2, aedeagus see Fig. 8. *impressifrons* n. sp.
