

Diagnosen der neuen Arten von Lebermoosen, welche die Novara-Expedition mitbrachte.

Von

Dr. H. W. Reichardt,

k. k. Custos-Adjuncten und Docenten an der Wiener Universität.

Vorgelegt in der Sitzung vom 7. November 1866.

Anthoceroteae.

Anthoceros gracilis Rchdt. Frons laevis, enervis, repetito diffusa; laciniae polymorphae, margine plano vel ascendentē repando-crenulatae. Fructus sparsi, gracillimi, $1\frac{1}{2}$ " longi; perianthium cylindricum, ore oblique truncato, bifido, denticulato; pedicellus perianthium superans, quartam capsulae partem aequans; capsula fuscescens. Sporae tetraëdrae, $\frac{1}{300}$ " magnae, granulatae, flavescentes; elateres fusiformes, plerumque simplices, exactissime monospori.

Neu-Holland. An feuchten Stellen um Sidney; leg. Jelinek.

Marchantiaceae.

Marchantia hexaptera Rchdt. (*Chlamidium.*) Frons linearis, $1\frac{1}{2}$ – 2 " lata, tenuis, costa angusta, subtus purpurascente percursa; pendunculi unciales, pilis hinc inde vestiti, ad insertionem receptaculorum barba pendula praediti. Receptacula mascula et feminea dimidiata, palmato-radiata; radii sex, discreti, late cuneiformes, membranacei, omnes profunde emarginati; discus papillatus, ex angulis subtus barbatus. In-

volucra margine laciniato-dentata, perianthia quadriloba, calyptre subbifidae; sporae fuscae, $\frac{1}{300}$ " magnae, tetraëdrae, granulatae; elateres monospiri.

Tahiti. In Urwäldern um Fataua auf feuchter Erde; leg. Jelinek.

Jungermannieae.

Lejeunia paritiicola Rchdt. Caules graciles, repentes, 3-4', longi, caespites extensos, fuscantes formantes, subpinnatim ramosi. Folia suborbicularia, obtusa, integerrima vel repandula, convexiuscula, basi subsinuato-complicata; plica saccata, oblique semiorbicularis, folio multo minor. Amphigastria foliis vix minora, rotunda, convexa, apice bidentata, dentibus brevibus, obtusiusculis. Fructus in ramulis brevissimis laterale; foliorum involucrarium par superum oblongum, lobulo oblongo, folio triplo minori; amphigastrium illis caulis conforme. Perianthia obovato-clavata, sursum acute quinquangularia. Capsulae sporae, elateresque desiderantur.

Tahiti. Auf faulenden Stämmen von *Paritium tiliaceum* A dr. Juss. in den Umgebungen von Papete grosse, ausgedehnte Rasen bildend; leg. Jelinek.

Thysonanthus Frauenfeldii Rchdt. Caulis primarius repens; rami erecti, dichotomi pinnative subtus nudi. Folia subhorizontalia, plana, ovato-oblonga, acuminata, integerrima vel apicem versus repandula, medio cellulis elongatis vittata; lobulus plicaeformis folio multo minor, oblongus, planiusculus. Amphigastria subimbricata, foliis triplo minora, clavato rotundata, integerrima, apice patulo reflexo-emarginata. Fructus terminales et in dichotomia; folia involucralia oblonga, acuta, margine repando, lobulo discreto, oblongo, acuto; amphigastrium involucrale magnum, obovatum, margine repandum. Perianthium clavato-cylindricum, triquetrum, angulis integerrimis, apice dentatum. Capsulae maturae, sporae, elateresque desunt.

Tahiti. An Baumstämmen um Papete; leg. Jelinek.

Mastigobryum Hochstetteri Rchdt. Caulis decumbens, repetito-dichotomus, flagellifer. Folia approximata, laxe imbricata, semiverticalia, oblique semiovato-falcata, enervia, apice acute tridentata, dentibus divergentibus. Amphigastria libera, approximata, rotundato-quadrata, quartam foliorum partem magna, apice acute quadridentata, marginibus lateralibus revolutis. Perianthia ignota.

Neu-Seeland. An alten Stämmen in Wäldern um Coromandel; leg. v. Hochstetter.

Lophocolea Jelinekii Rchdt. Caules repentes, ramosi, caespites extenos terrae adpressos formantes. Folia tenerrima, e cellulis parvis leptodermis composita, applanata, apice emarginato bicuspidata, rarius unidentata, dentibus acuminatis; margines laterales integerrimi, dorsalis rectiusculus, ventralis rotundatus. Amphigastria parva, libera, bifida, sinu obtuso, laciniarum margines exteiiores irregulariter dentati. Flores fructusque ignoti.

St. Paul. Häufig an feuchten, humusreichen Stellen; leg. Jelinek.

Plagiochila Nicobarensis Rchdt. (*Adiantoideae, cucullatae.*) Caulis primarius repens; rami erecti, subsimplices vel furcati. Folia imbricata, horizontaliter patentia, semiovato-oblonga, apice rotundato; Margo ventralis longe dentato-ciliatus, basi cordatus; dorsalis breviter decurrens, denticulatus; amphigastria nulla. Flores masculi, feminei, fructusque ignoti.

Nikobaren. An den Stämmen von Baumfarnen; leg. Jelinek.

Plagiochila Fenzlii Rchdt. (*Vagae, distichae.*) Caulis primarius filiformis, nudus, repens; rami ascendentes, flagelliformes, vase ramosi, laxe intricati et caespites extenos formantes. Folia remotiuscula, subverticalia, patentia, nitida, oblongo-lanceolata, acuta breviter decurrentia, marginibus lateralibus integerrimis, apice spinuloso-tridentata. Folia involucralia oblique ovata, dentato-ciliata, perianthio longiora. Perianthia obovato-clavata, ore dilatato compresso ciliata. Seta perianthio

960
