

Hewittella flavomaculata sp. nov. ♀.

Rufo-testaceous; the face, the greater part of the vertex, the orbits narrowly and more or less of the pleurae, mesonotum and scutellum, yellow; the antennae, tips of mandibles, 2 large quadrangular marks on the 5th abdominal segment and the hind legs, except the joints, black; wings hyaline, the base slightly suffused with yellow; the stigma and costa fuscous, the former pale at the base; the nervures are paler; the apical segments of the abdomen are pale testaceous. — Length 6 mm; terebra 1 mm.

Sarawak, Borneo (Hewitt).

Smooth, shining; a rugose space, narrowed above, over the mouth; the front depressed. Mesonotum and scutellum flat, especially the former at the apex; the latter is more elevated than the former. Abdomen closely rugosely punctured; the area on 2nd segment punctured, smooth at the base, its apex is produced shortly beyond the middle of the segment; this narrowed apical part is depressed in the centre, the sides sharp, forming keels; there are 3 distinctly defined, crenulated furrows; the apices of the segments are smooth. Legs covered with short pubescence. The amount of the black and yellow colour varies.
